

# Biodiversity and human well-being

Patricia Balvanera

Center for Ecosystem Research (CIECO)  
National University of Mexico (UNAM)  
[pbalvanera@cieco.unam.mx](mailto:pbalvanera@cieco.unam.mx)

**Our planet has been  
deeply transformed to  
cope with the increasing  
demand from human  
societies**

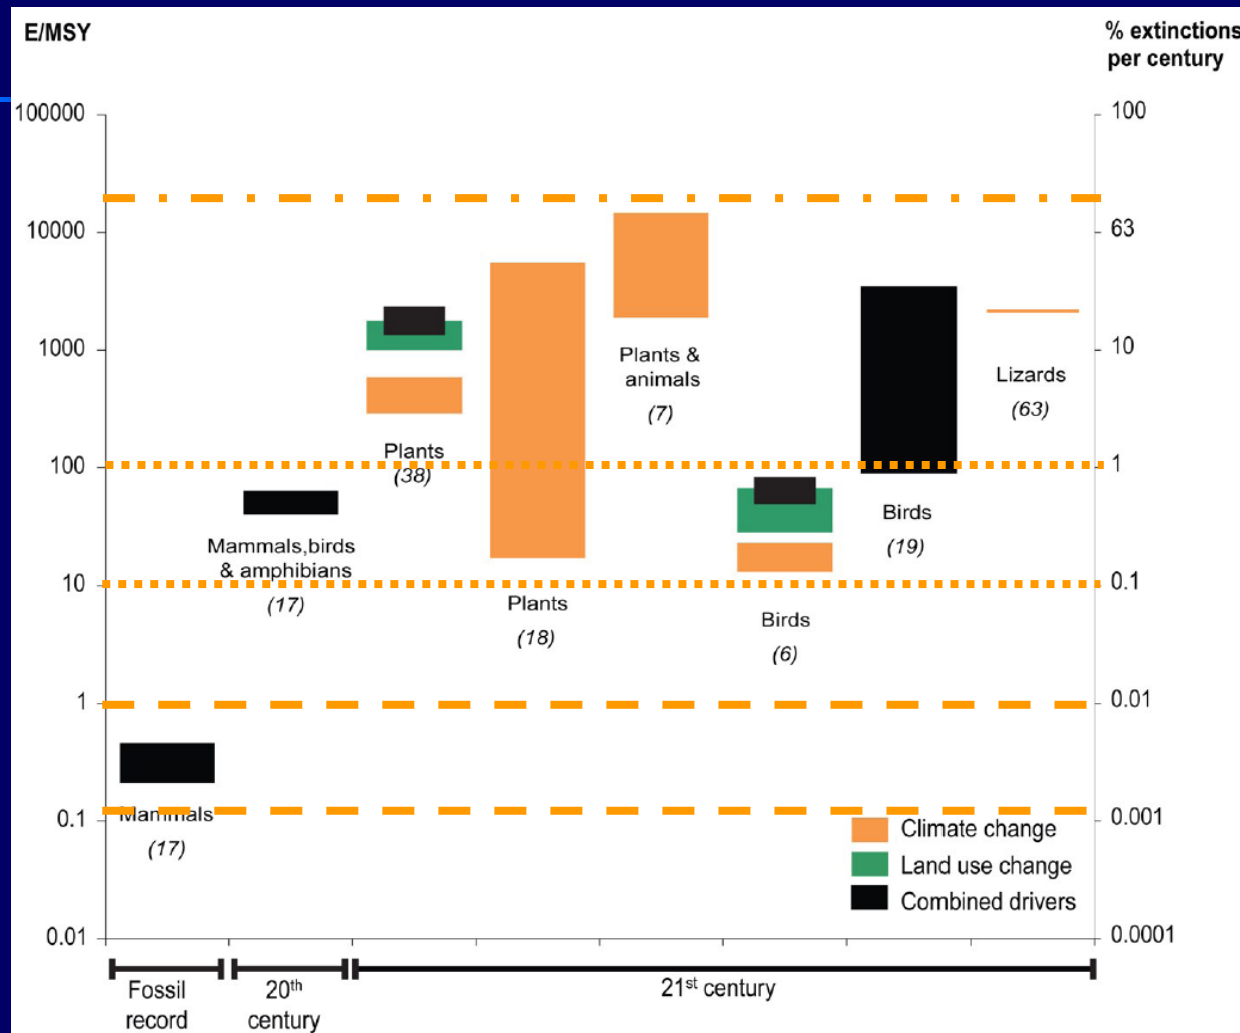

We have crossed various planetary boundaries of unacceptable environmental change

Rockstrom et al. 2009 Nature 461: 472-475

# Extinction rates are much higher today than in the past and will increase in the near future

Number of extinctions per million years per species

Future  
Similar to  
1000 times  
higher

Present rates  
10 to 100  
Times higher

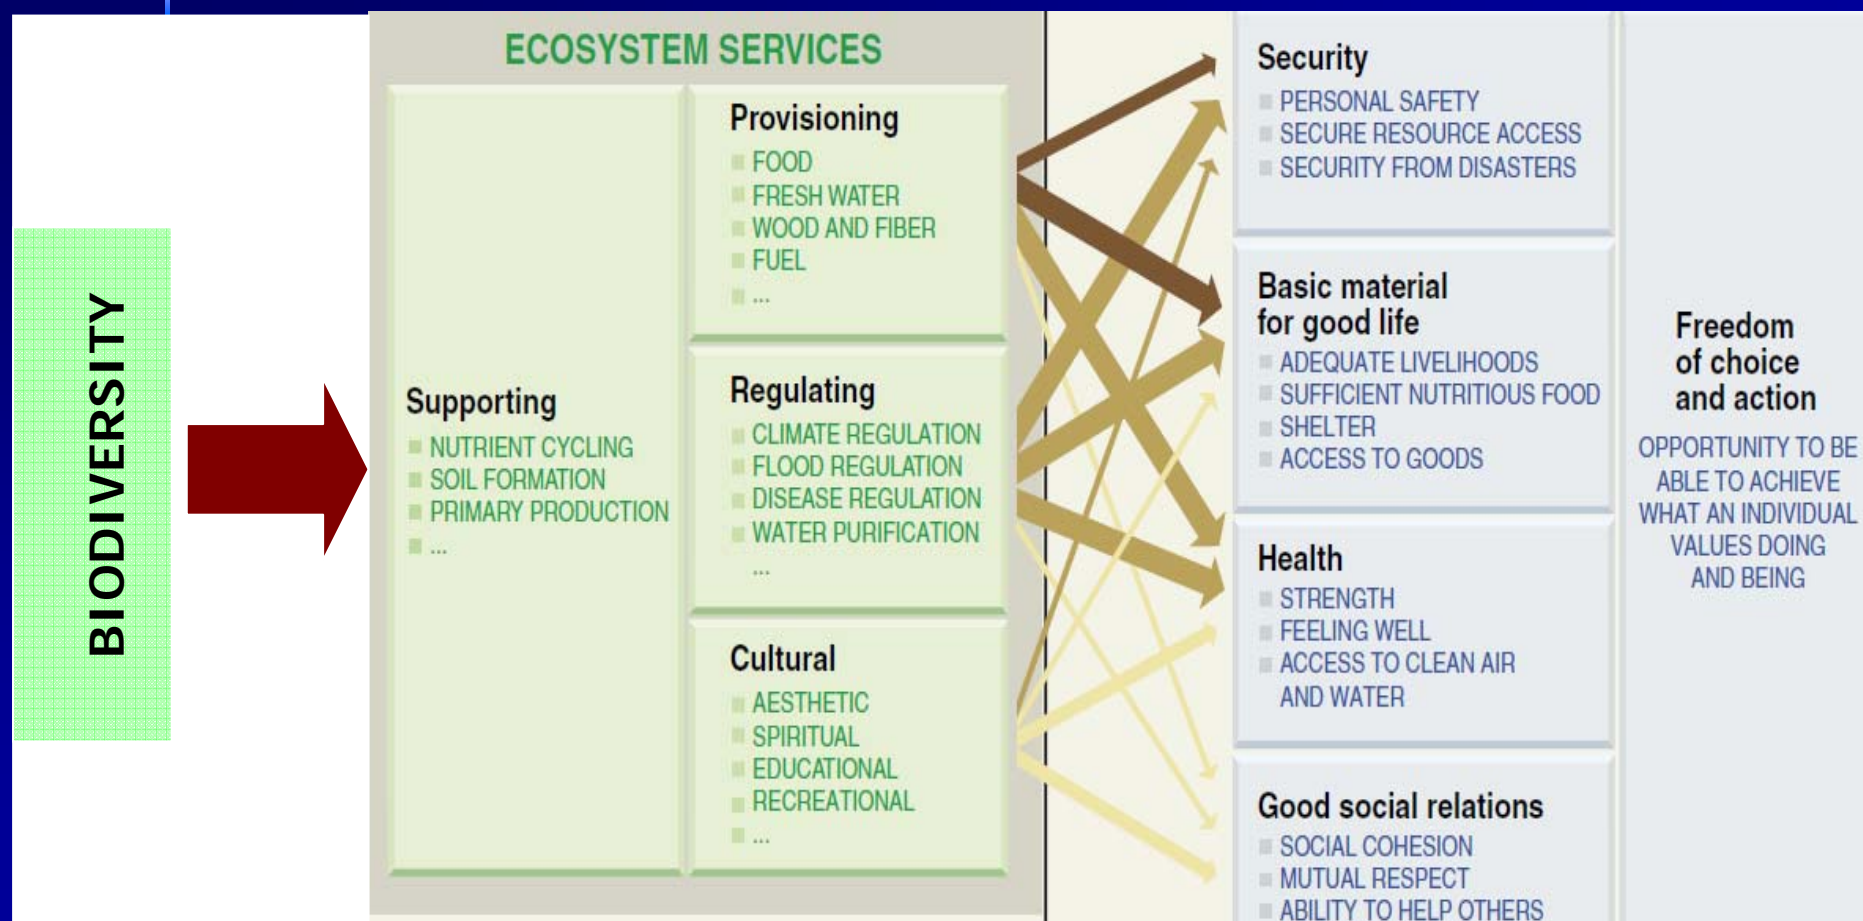

Past rates

**This biodiversity loss is likely to have negative consequences on human well-being**

Biodiversity is linked to human well-being because it affects the ability of ecosystem to provide benefits or services to societies

BENEFITS SOCIETIES  
OBTAIN FROM ECOSYSTEMS

COMPONENTS OF  
HUMAN WELL-BEING

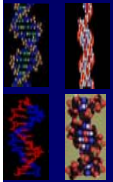

Millennium Ecosystem Assessment 2005

# Biodiversity is the variability among living organisms

## Diversity at different levels of organization

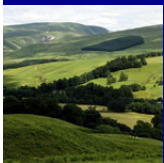

Genetic diversity  
within populations

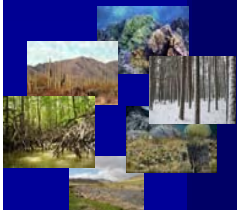

Population diversity  
within species

Species diversity  
within communities

Community diversity  
within landscapes

Biome diversity

## Different types of diversity

Number of species

Relative abundance

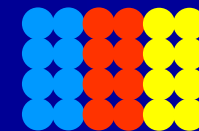

Composition

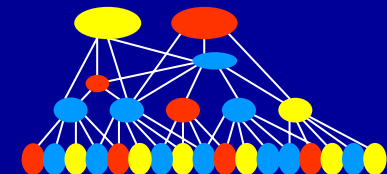

Range of functional  
traits

Spatial distribution

Vertical diversity

# Ecosystem processes and services underpin well-being

Ecosystem processes:  
interactions among abiotic  
and biotic components of  
ecosystem

Basic ecological  
processes that  
underpin  
ecosystem  
functioning and  
the ability to  
deliver  
ecosystem  
services

Ecosystem services: the  
benefits people obtain from  
ecosystems

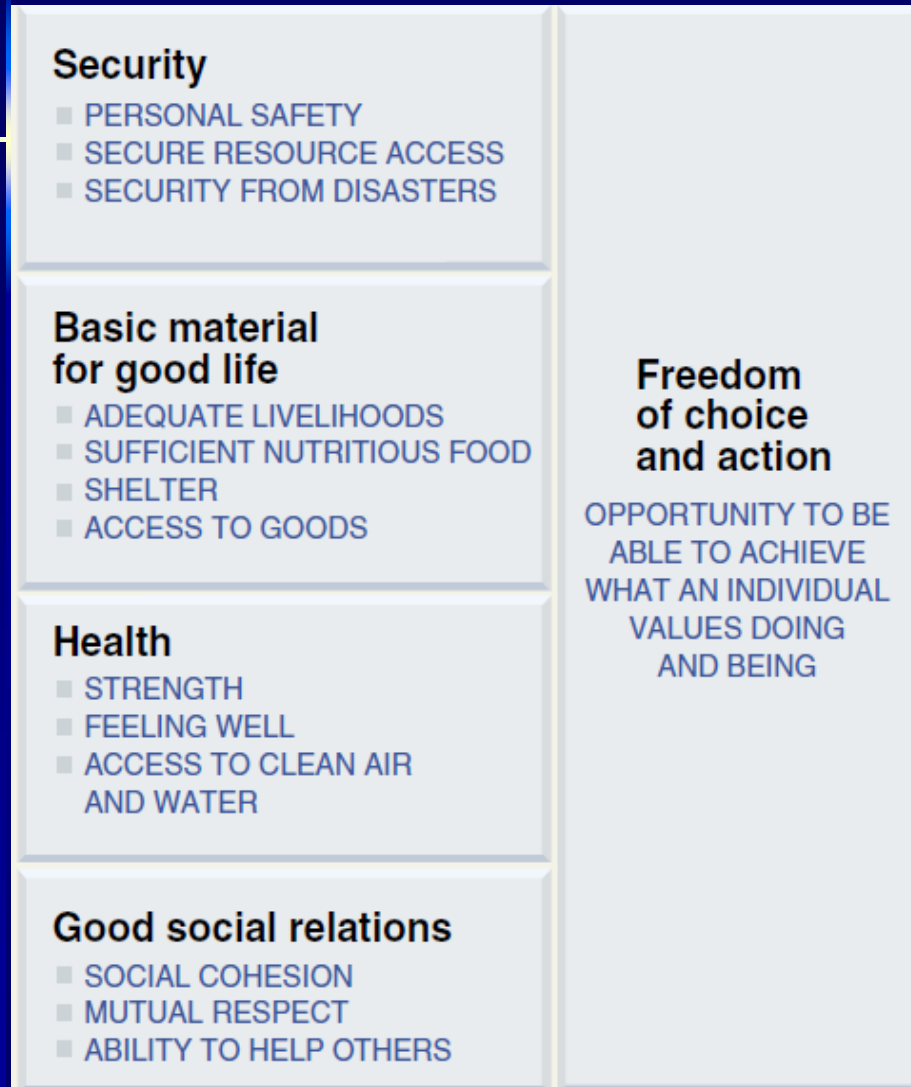

Resources that  
can be consumed,  
accounted for

Processes that  
regulate the  
variability in  
ecosystem conditions

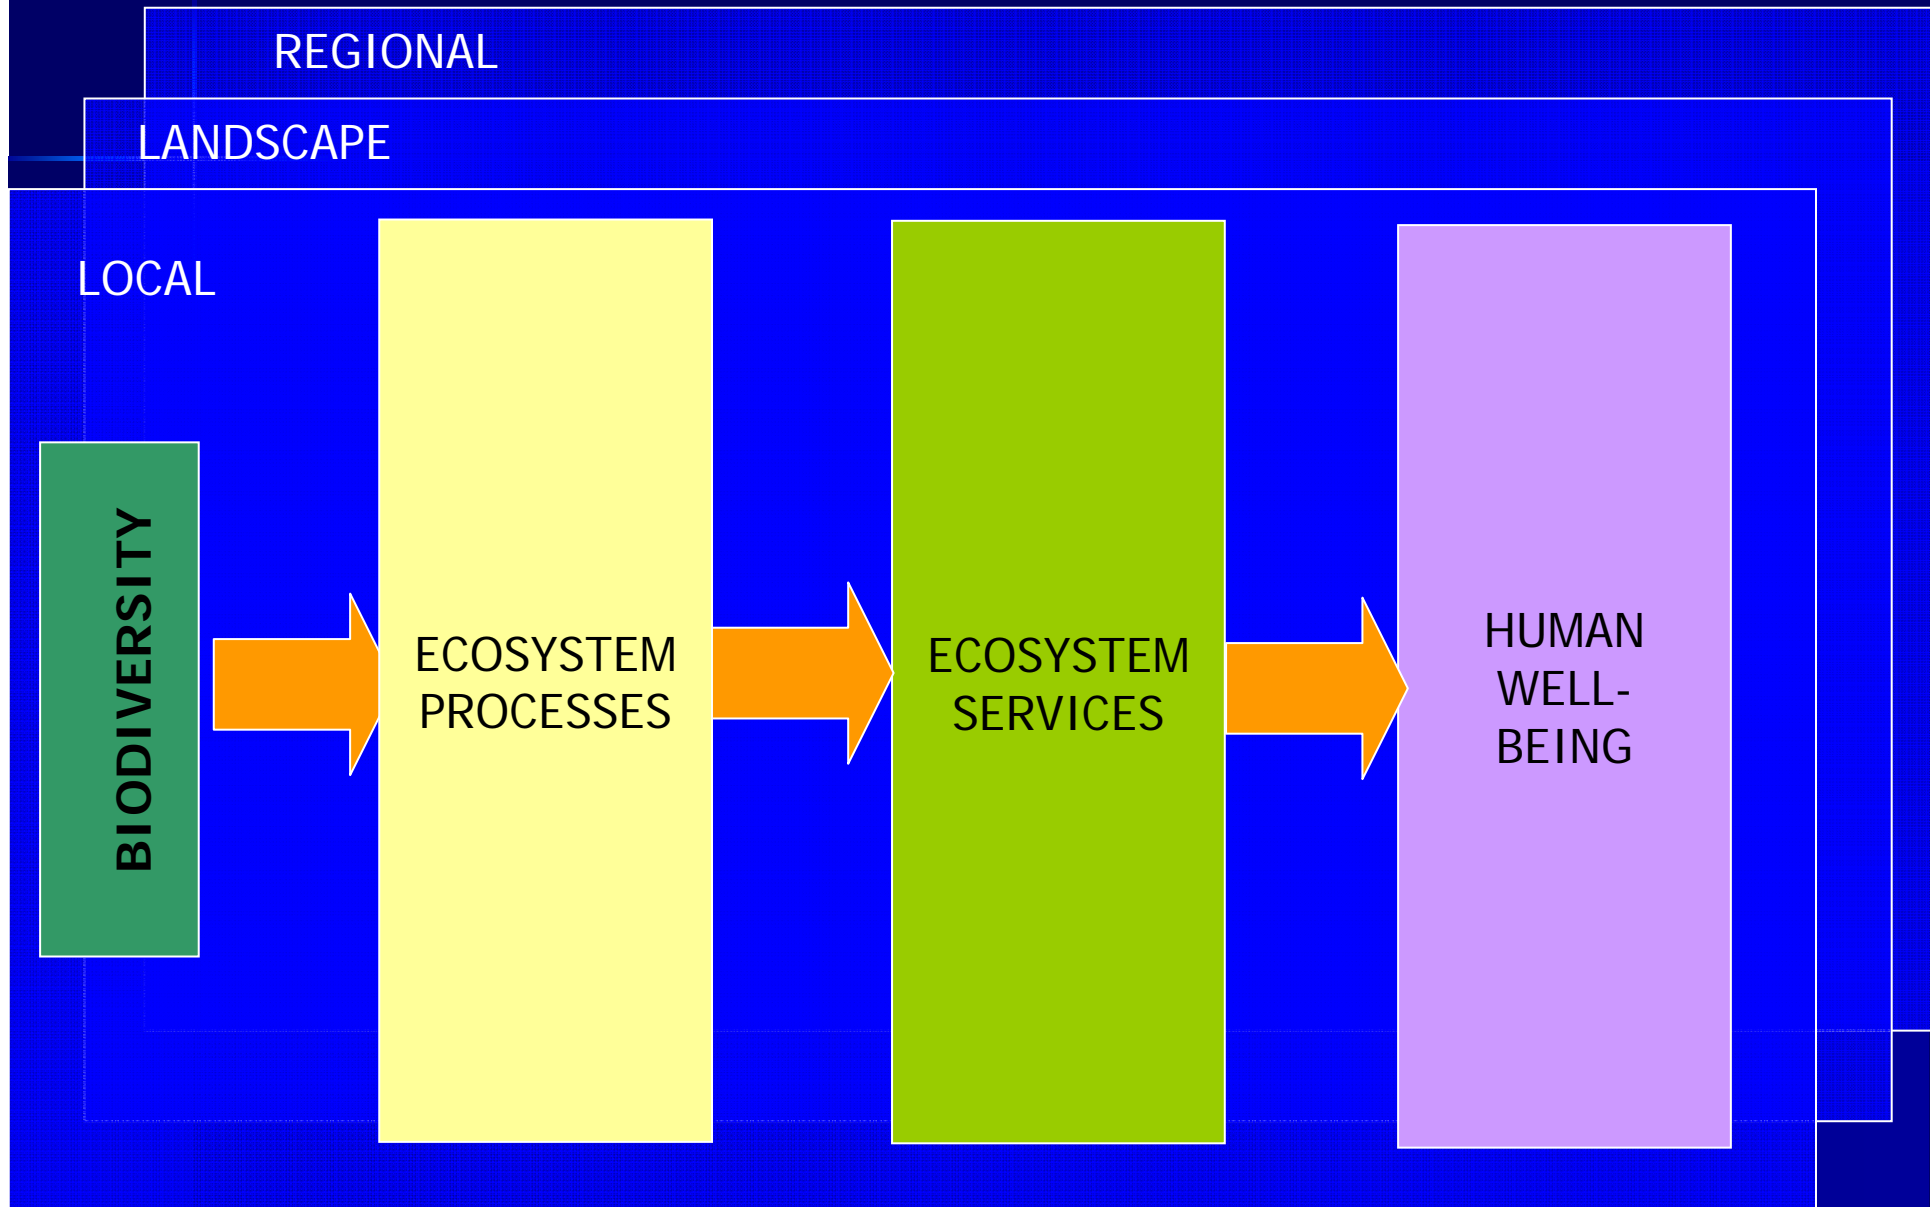

Benefits that  
arise from  
Human-ecosystem  
relationships

# Human well being can be assessed through its constituents

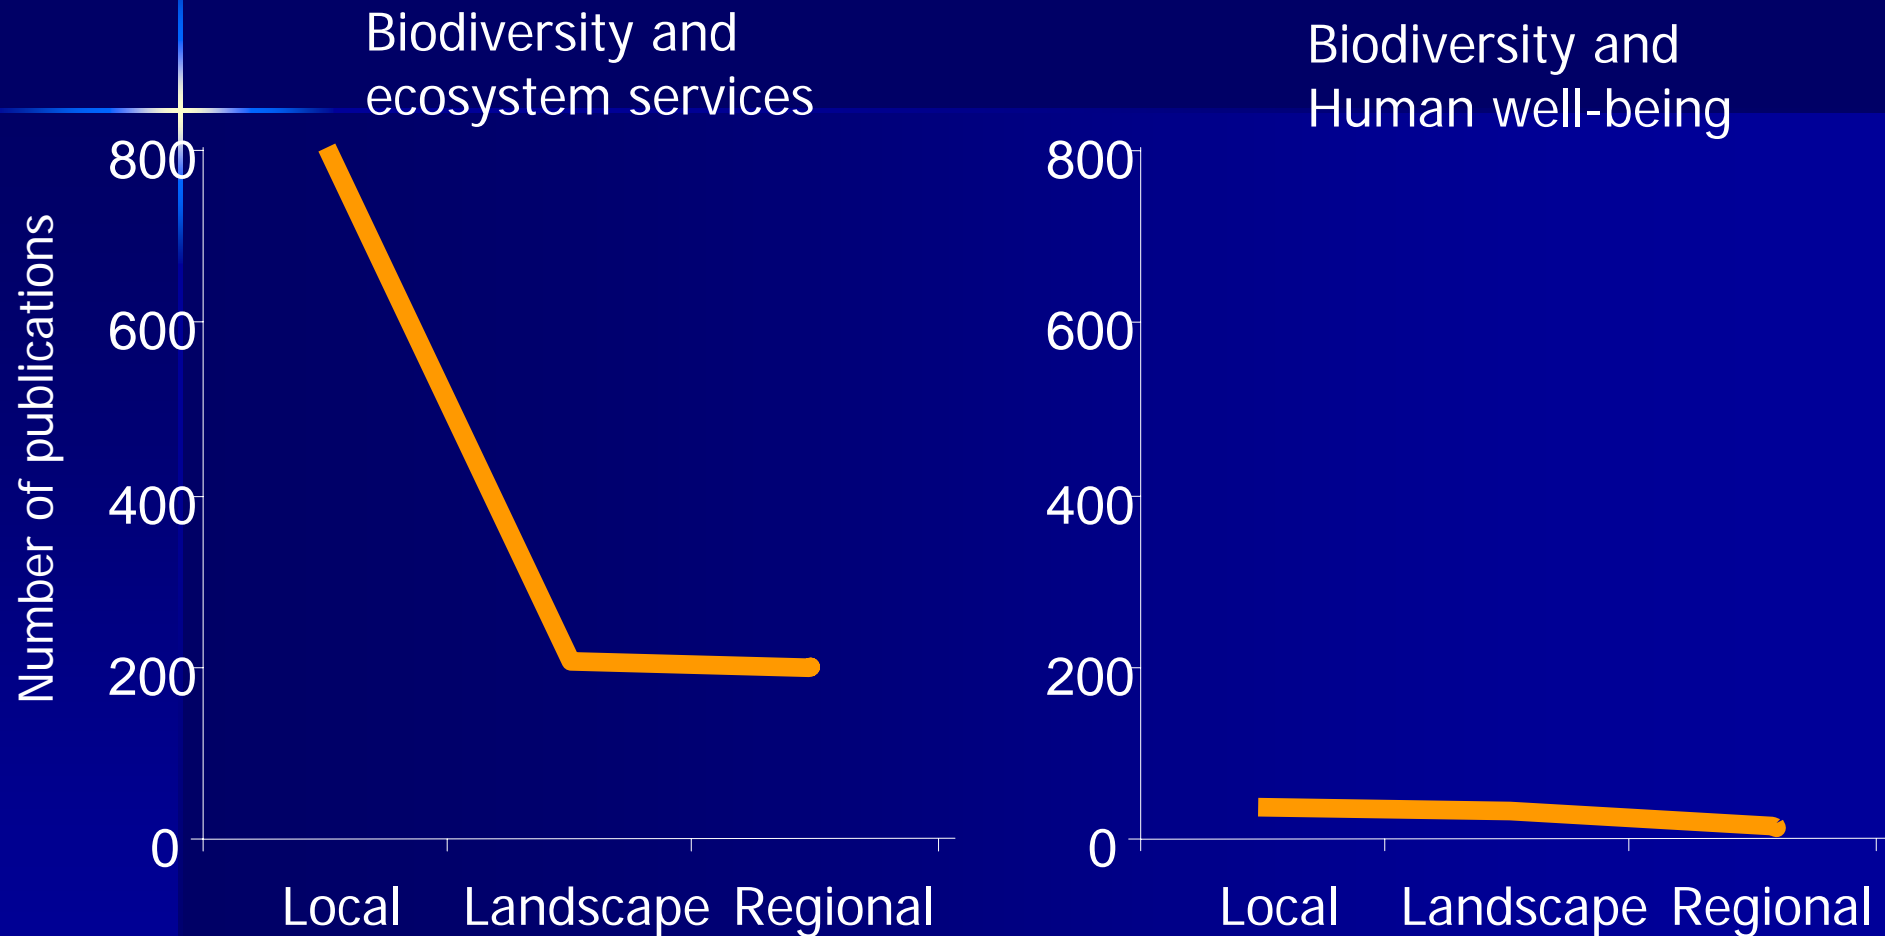

The relative importance of these constituents of well-being varies among stakeholders and among societies

We will analyze what we know about the links between biodiversity and well-being at various spatial scales

# The availability of information on the topic is uneven

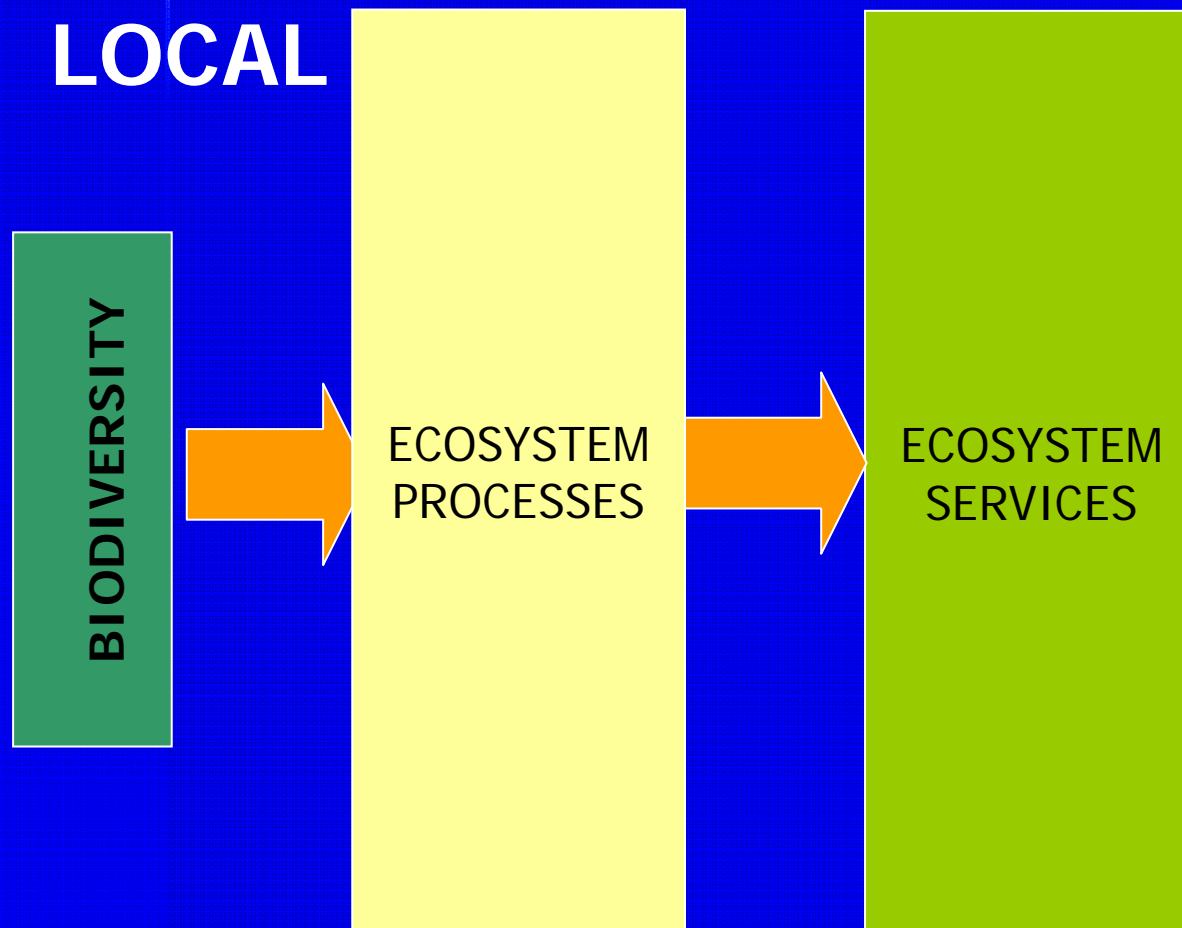

Only a small fraction of these references provide information relevant to the posed question

ISI Web of Knowledge 2010

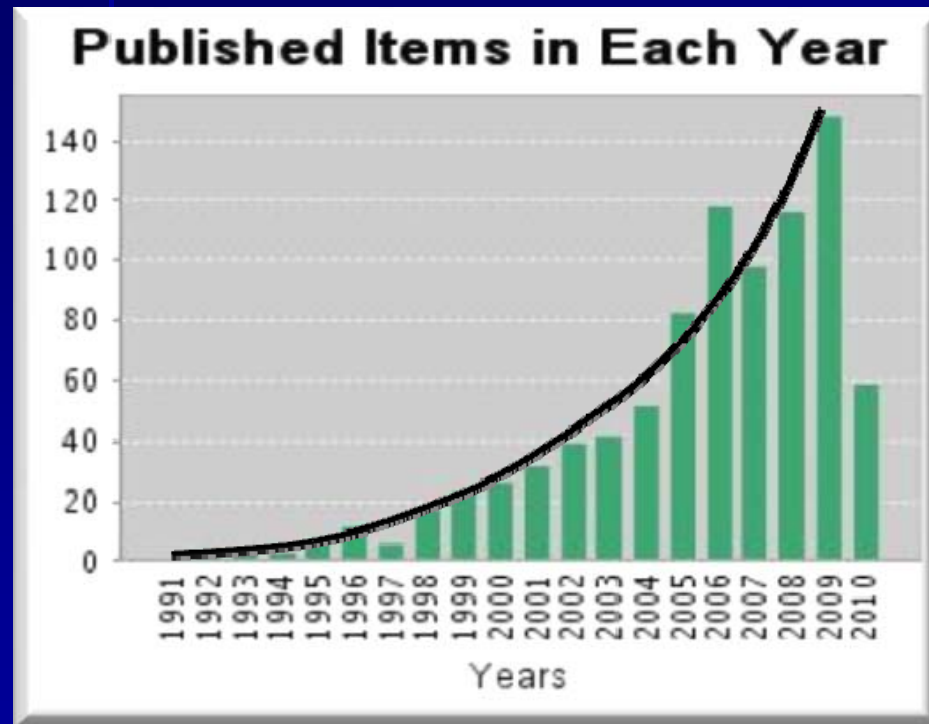

The links between biodiversity and ecosystem processes is very well known.

That for ecosystem services is not so well known

**LOCAL**

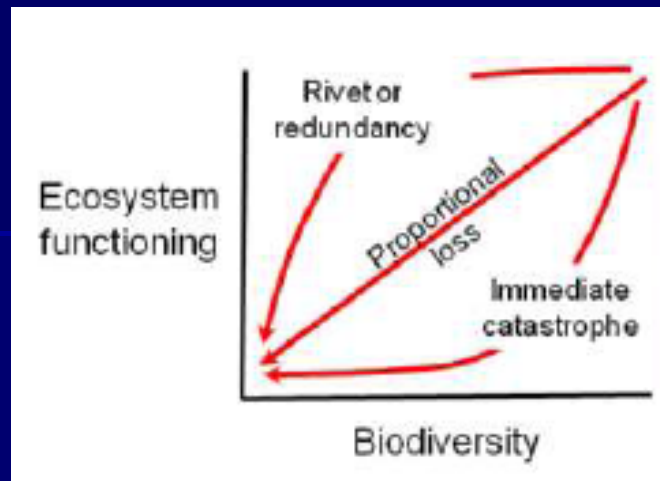

# Experimental studies have allowed the exploration of the links between biodiversity and ecosystem functioning

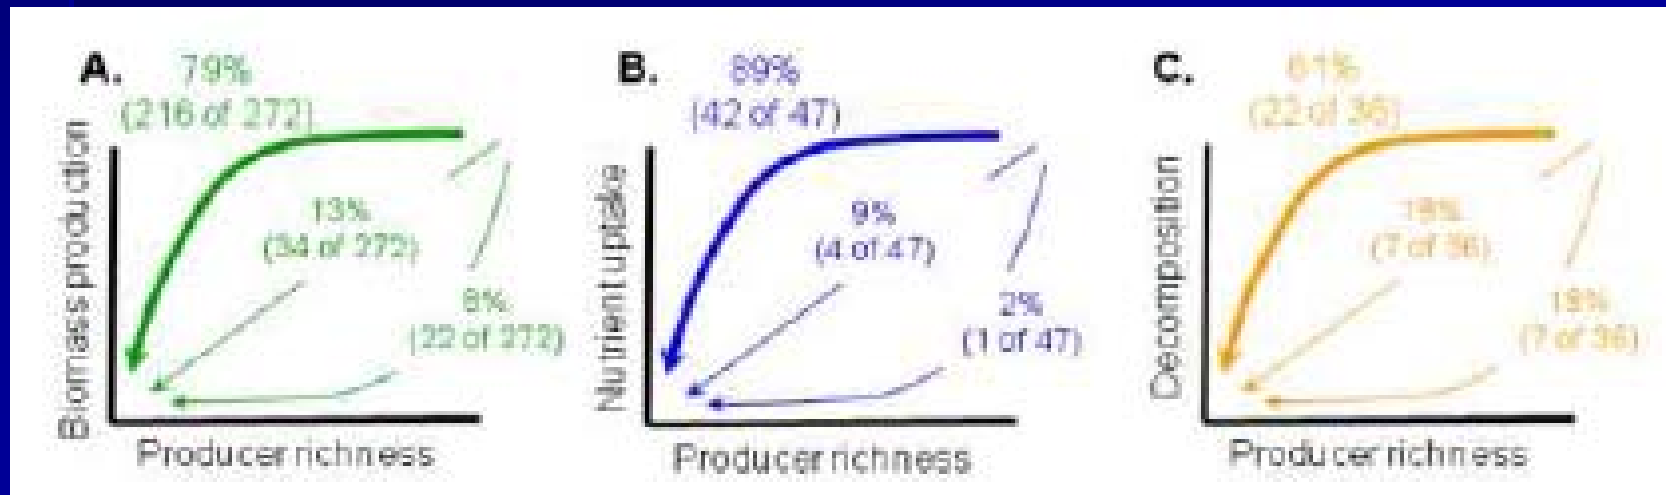

There has been an exponential increase in the number of publications from experiments

# What is the shape of the relationship?

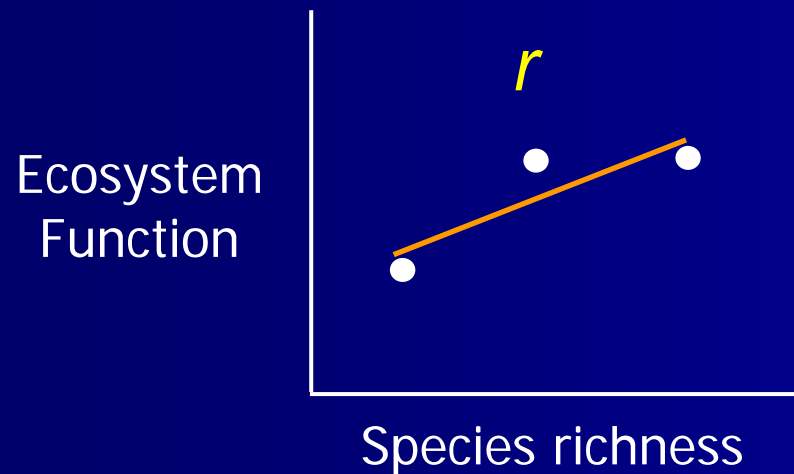

The dominant shape has been the rivet one

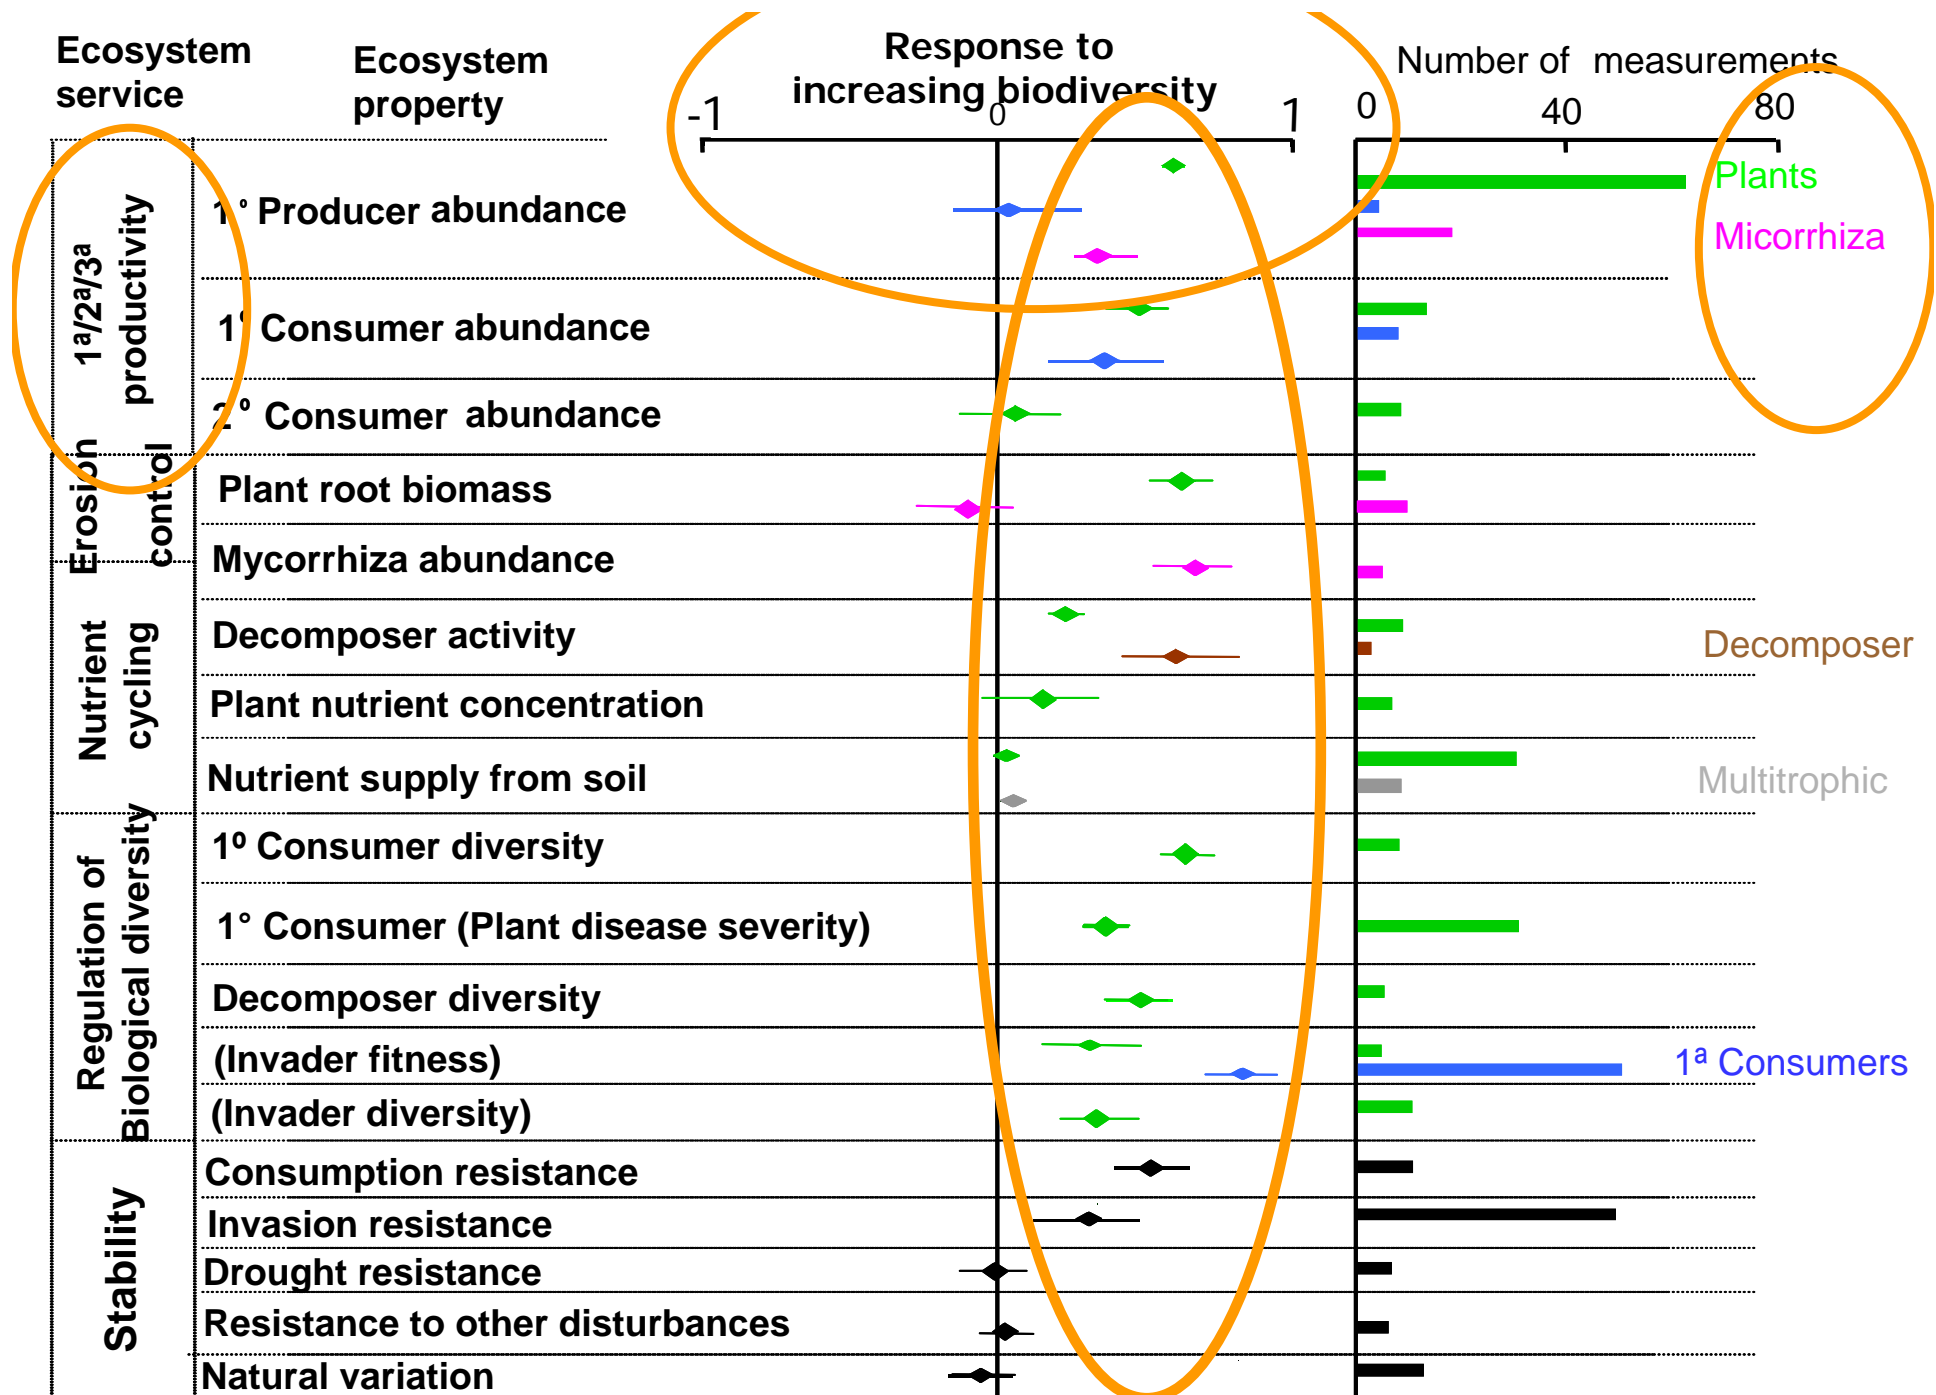

Cardinale et al. in press American Journal of Botany

# What is the direction of the relationship?

103 studies (1954-2004)  
ca. 450 diversity "effects"

Balvanera, Pfisterer, Buchman, He, Nakashizuka, Rafeeli, Schmid  
2006 Ecology Letters 9: 1146–1156

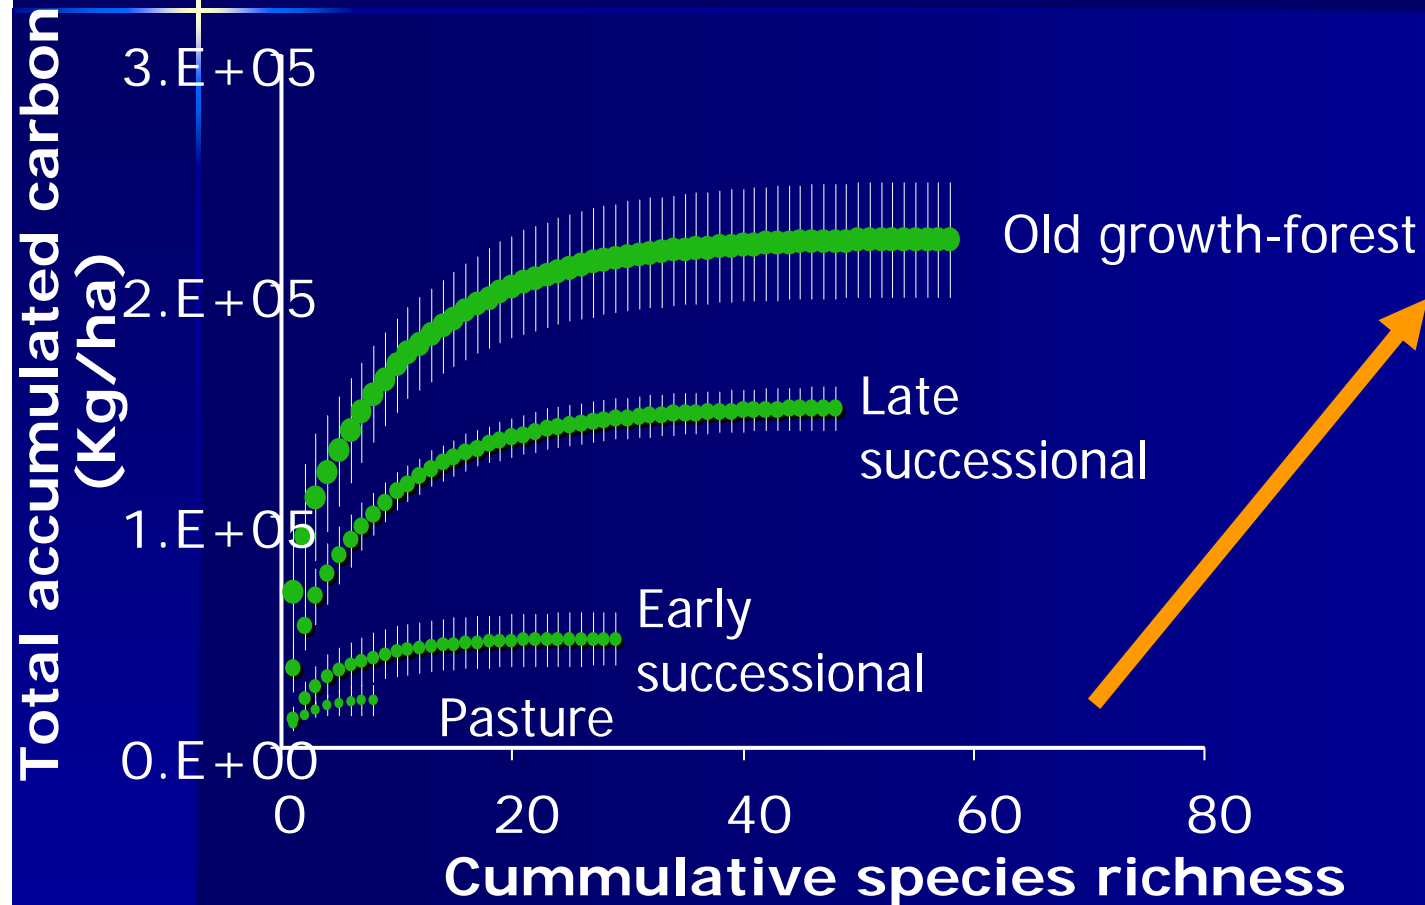

# **We found clear positive effects of biodiversity on most ecosystem services analyzed**

These effects were analyzed across multiple ecosystem types, multiple trophic levels, and multiple functions pointing towards consistency

Yet, little is known for many types of ecosystems, e.g. very diverse systems such as tropical forests

# We are analyzing links between biodiversity and ecosystem services for successional tropical forests

## Aboveground carbon storage

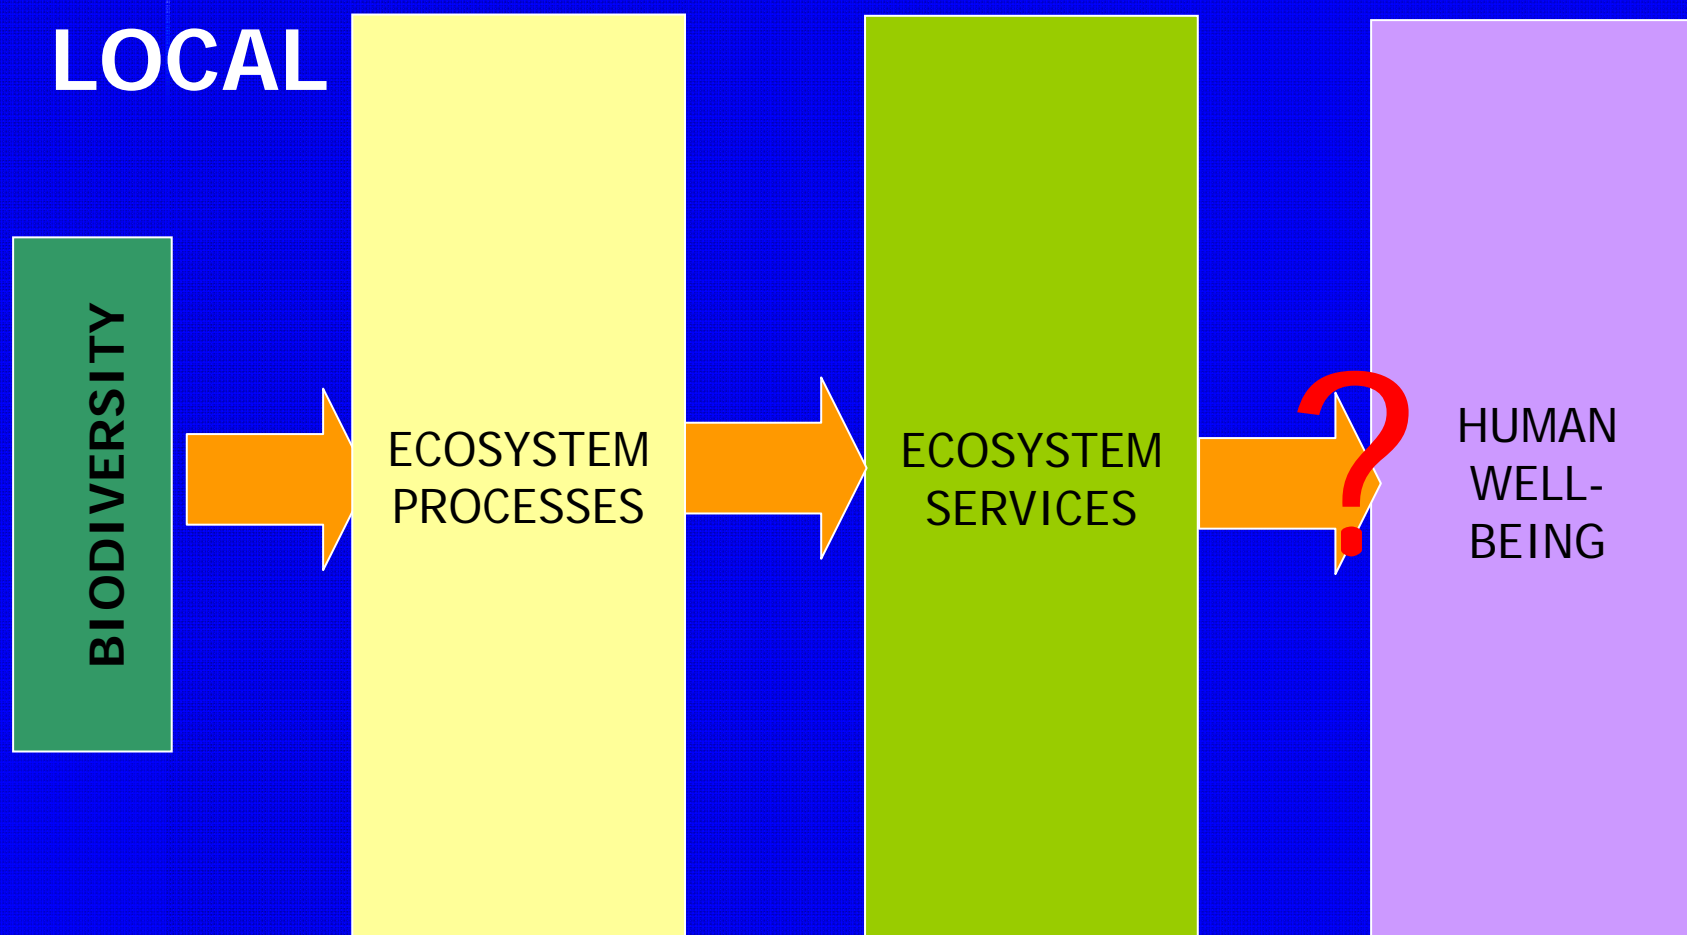

Increasing richness and magnitude of service along succession

Balvanera et al 2005 Ecological Applications 15:360-375, Balvanera et al in prep.

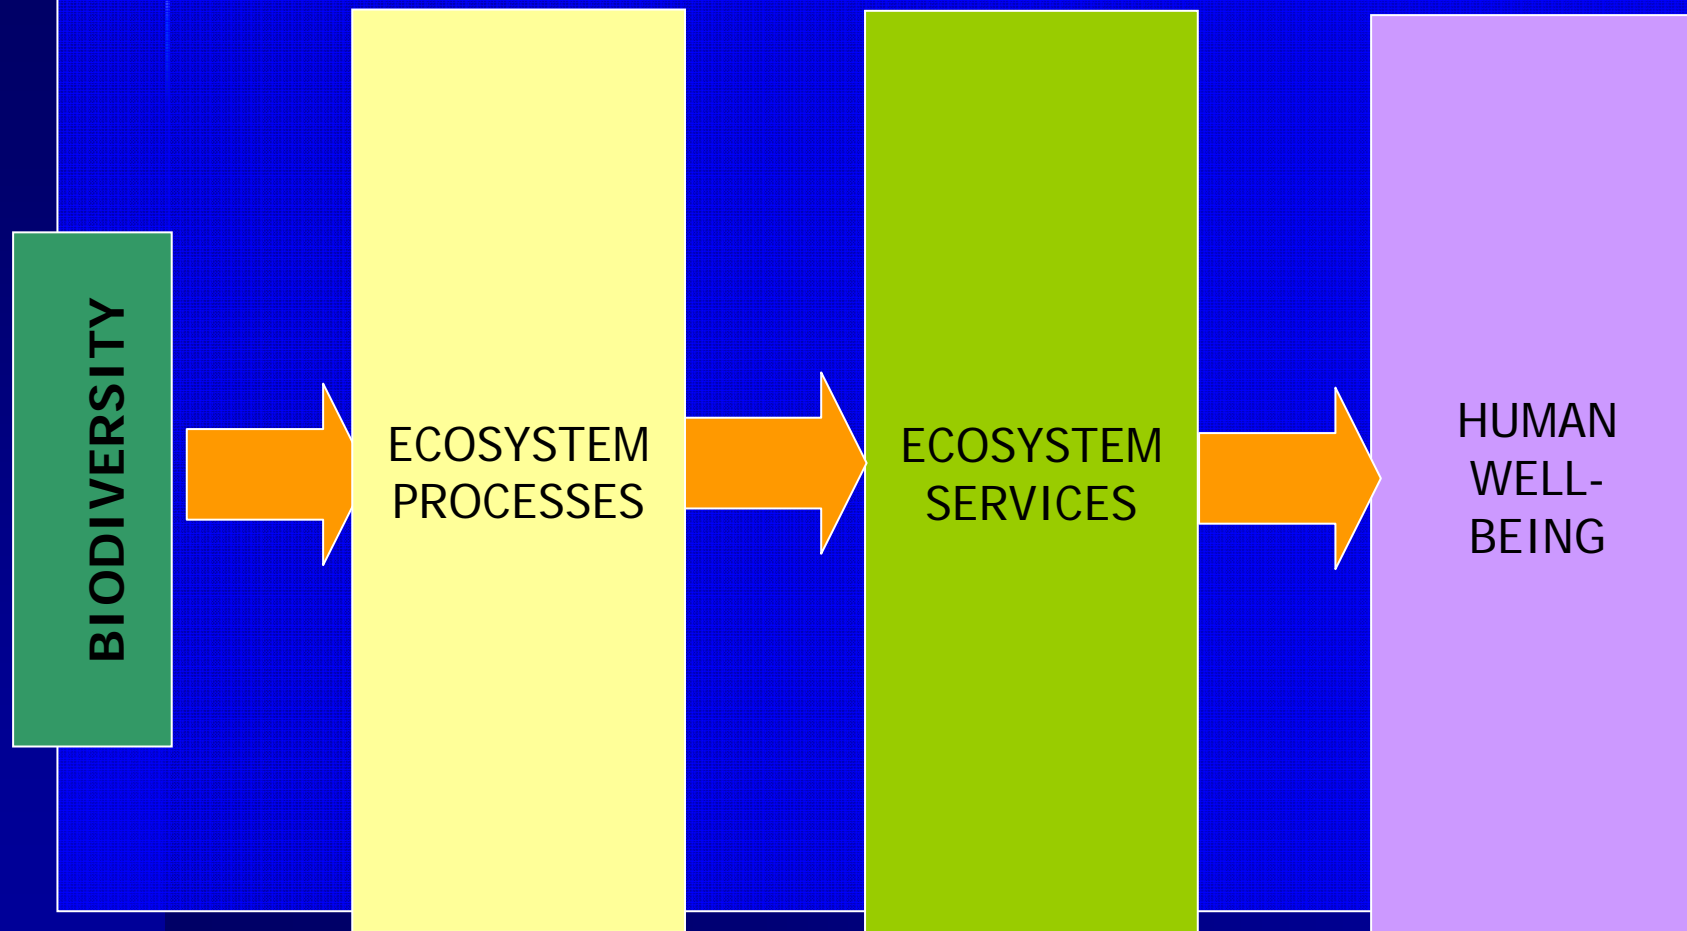

Much less is known for the links to well-being  
at the local scale  
How different components of well-being are related  
to biodiversity?

**LOCAL**

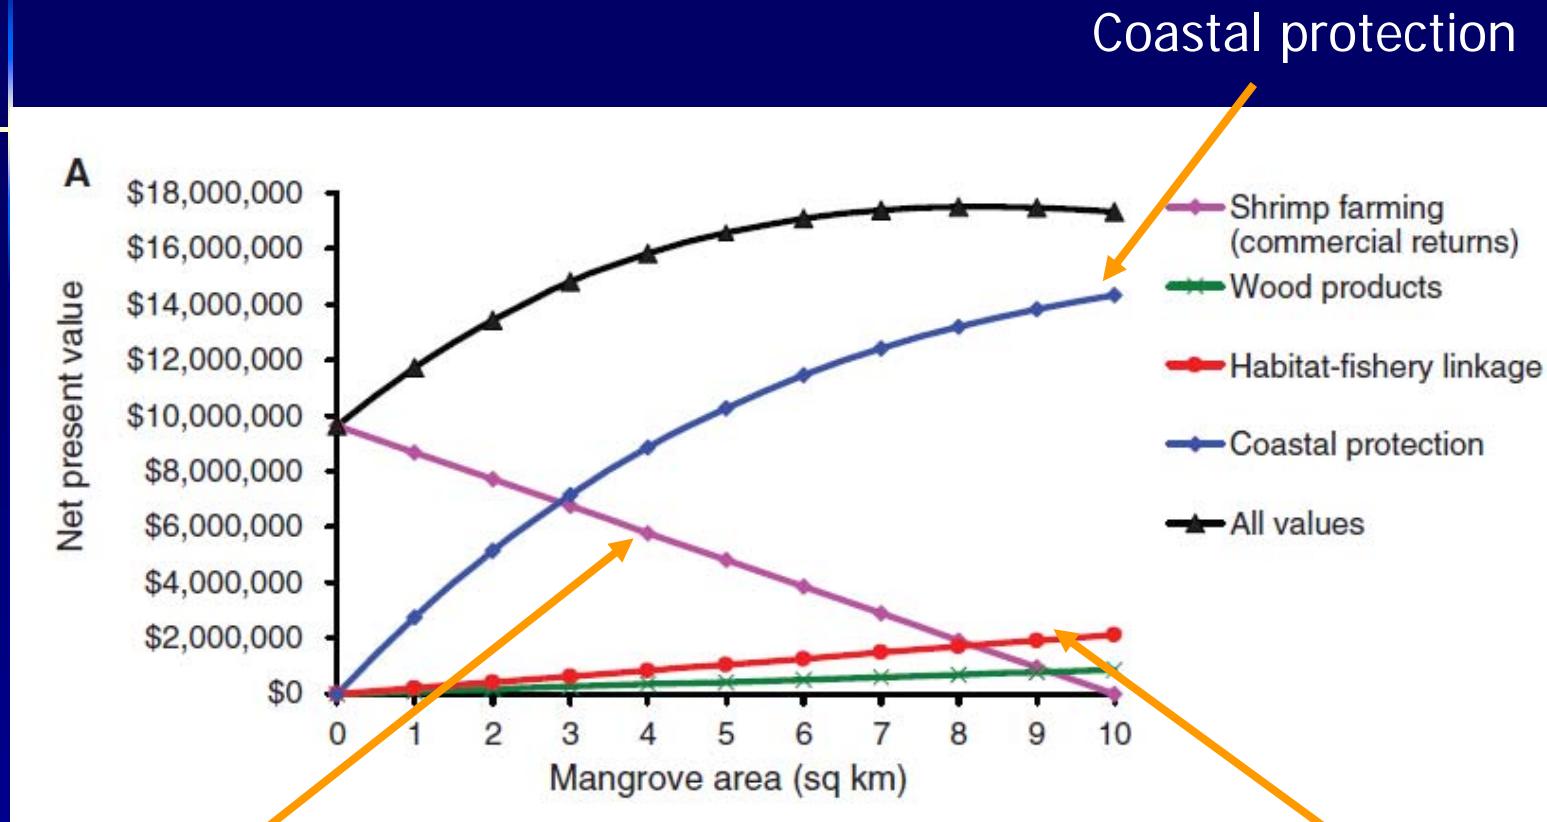

Little is known on the links between biodiversity, ecosystem services and well-being at landscape scales

## LANDSCAPE

# Biodiversity within mangroves provides human well-being

Decreasing shrimp farming  
Profit as mangrove area increases

Mangroves provide habitat for fisheries

# Biodiversity is a direct source of food, fuel, medicine for rural populations of the world

| EXAMPLE               | NUMBER OF<br>NON-TIMBER<br>FOREST<br>PRODUCTS | NUMBER OF<br>PEOPLE<br>BENEFITED |
|-----------------------|---|----------------------------------|
| San Lorenzo<br>Pápalo | 397   | 200                              |
| Mexico                | Ca 7,000                                      | 22,000,000                       |
| World                 |   | 300,000,000                      |

Various components  
Of well-being

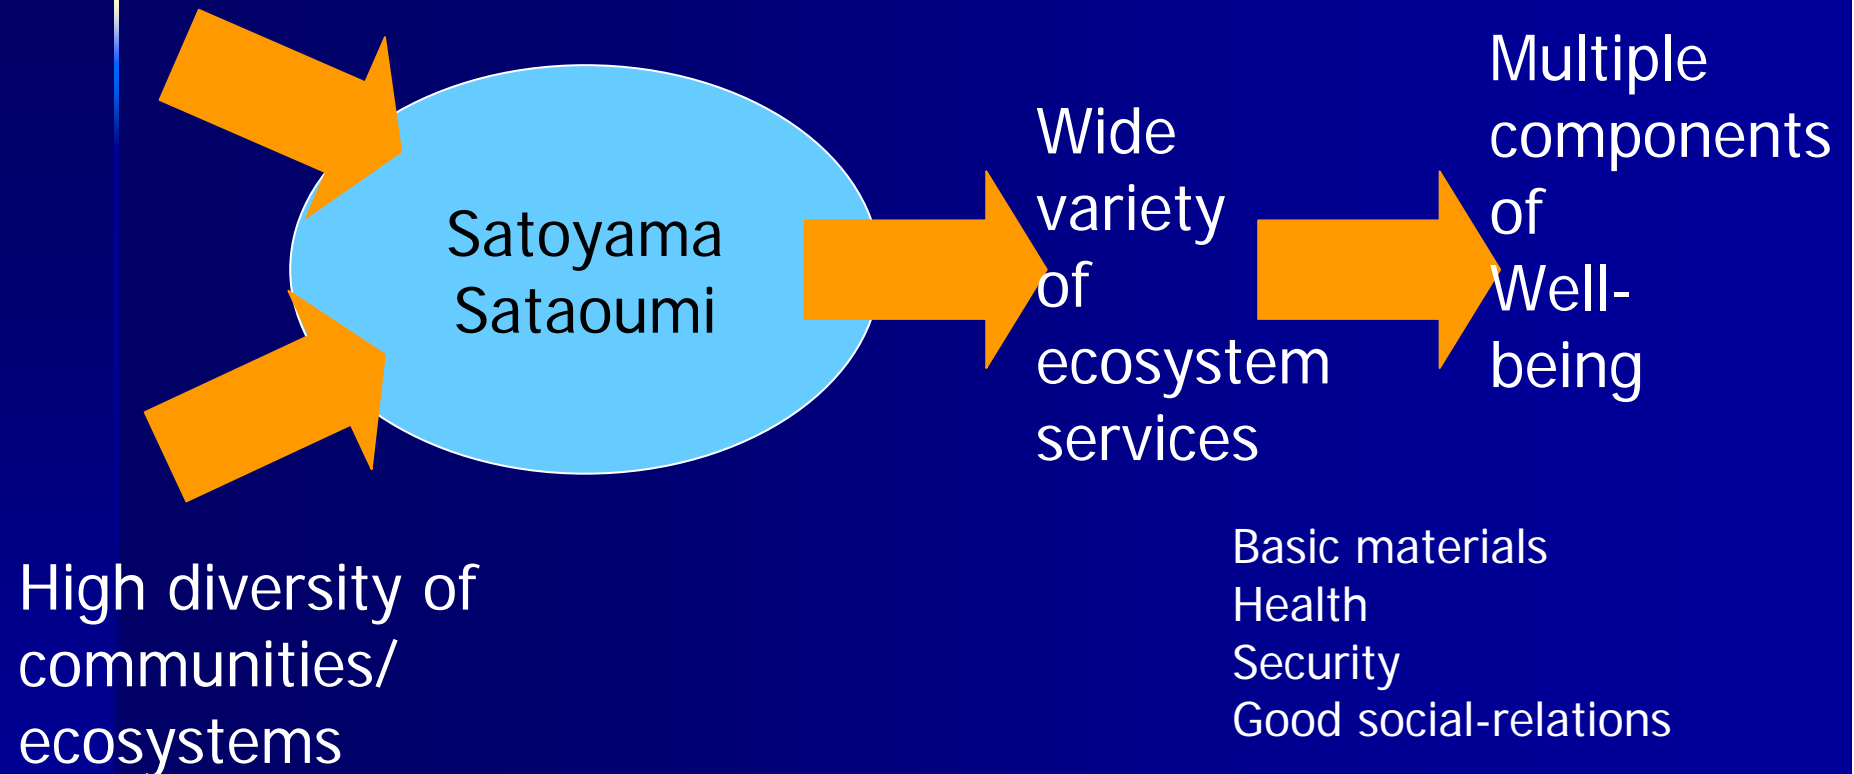

Basic materials  
Health  
Security  
Good social-relations

Solís 2006 MSc Thesis, Balvanera et al. 2009 Capital Natural de México

# Biodiversity within Satoyama and Sataoumi is important for human well-being

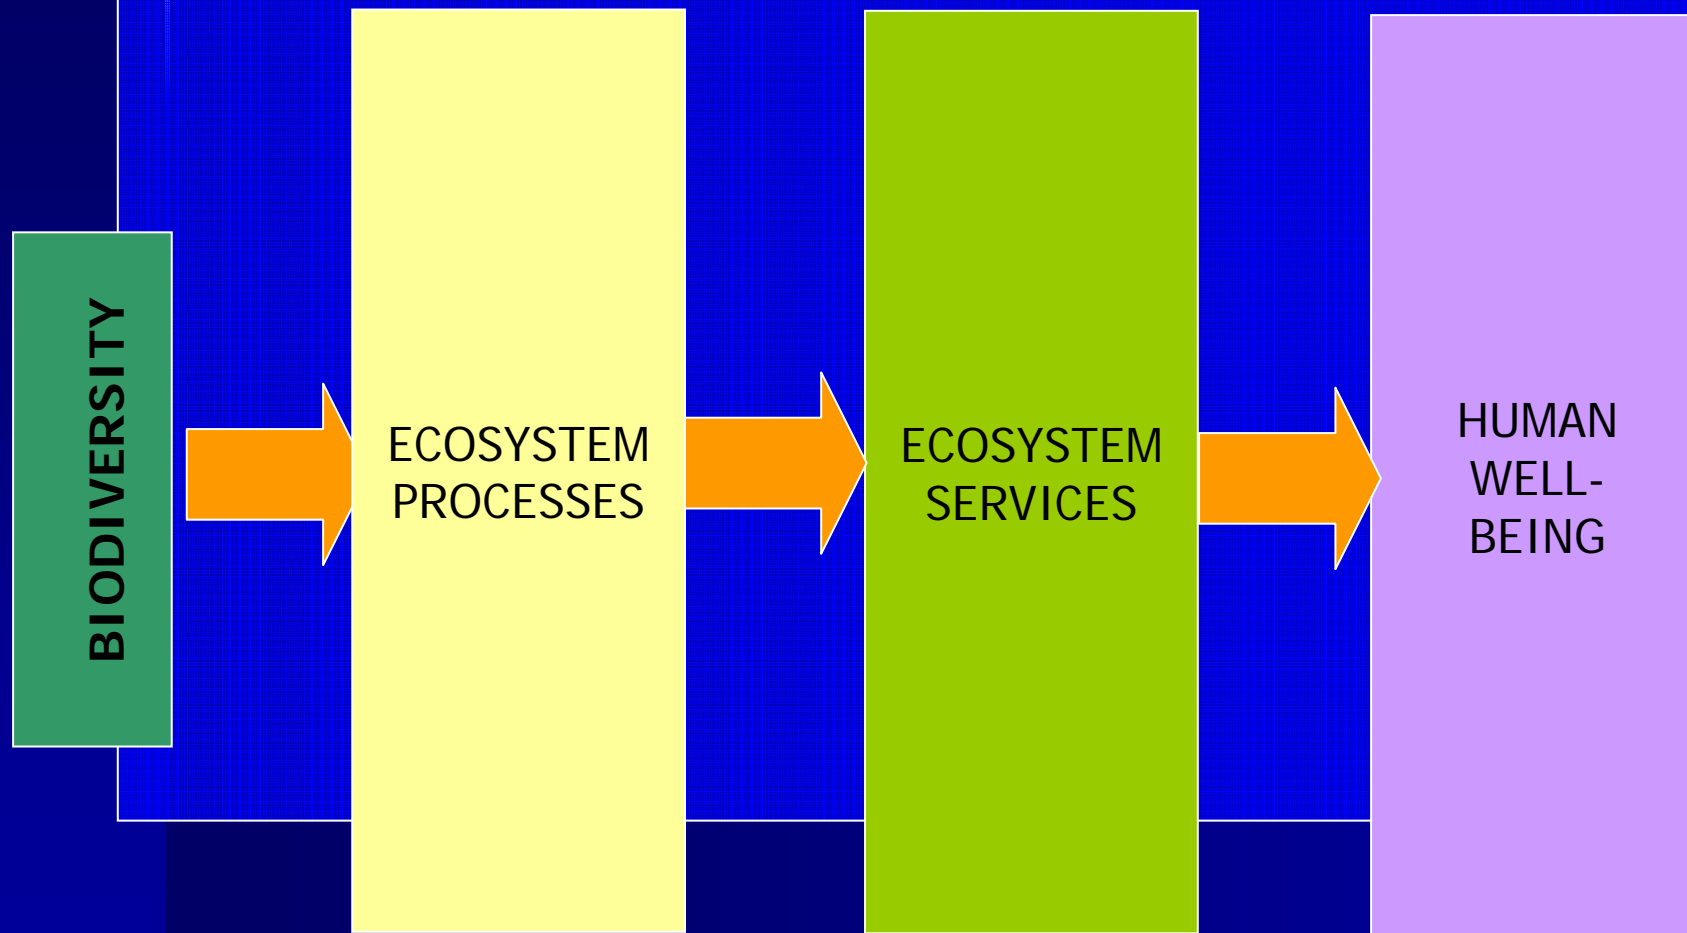

High species diversity

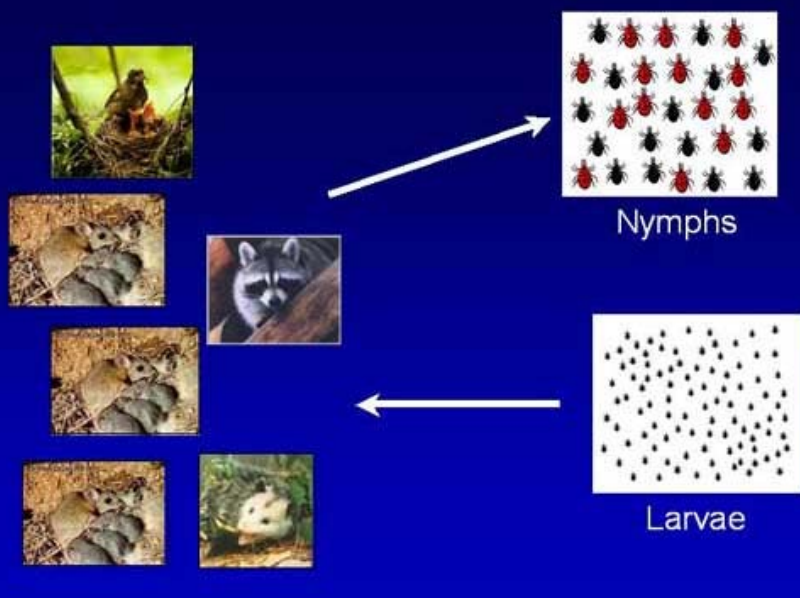

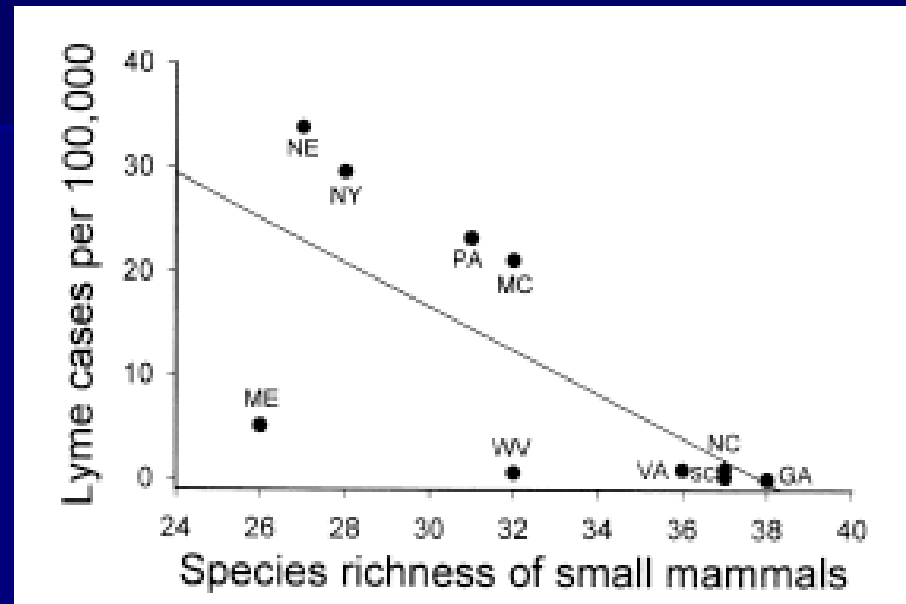

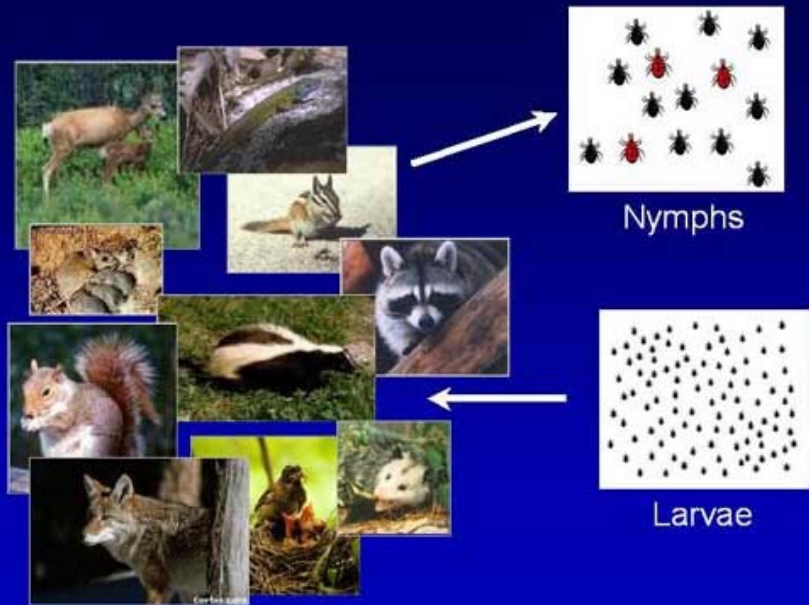

**Biodiversity is important  
to services and well-being  
at landscape scales,  
though the patterns are  
not simple**

Some studies have analyzed the link between biodiversity, ecosystem services and well-being at regional scales

## REGIONAL

The higher the biodiversity the lower the disease incidence

Tick

Bacteria  
*Borrelia burgdorferi*

White-footed mouse  
(*Peromyscus leucopus*)

Ostfeld & Keesing. 2000. Conservation Biology 14: 722–728

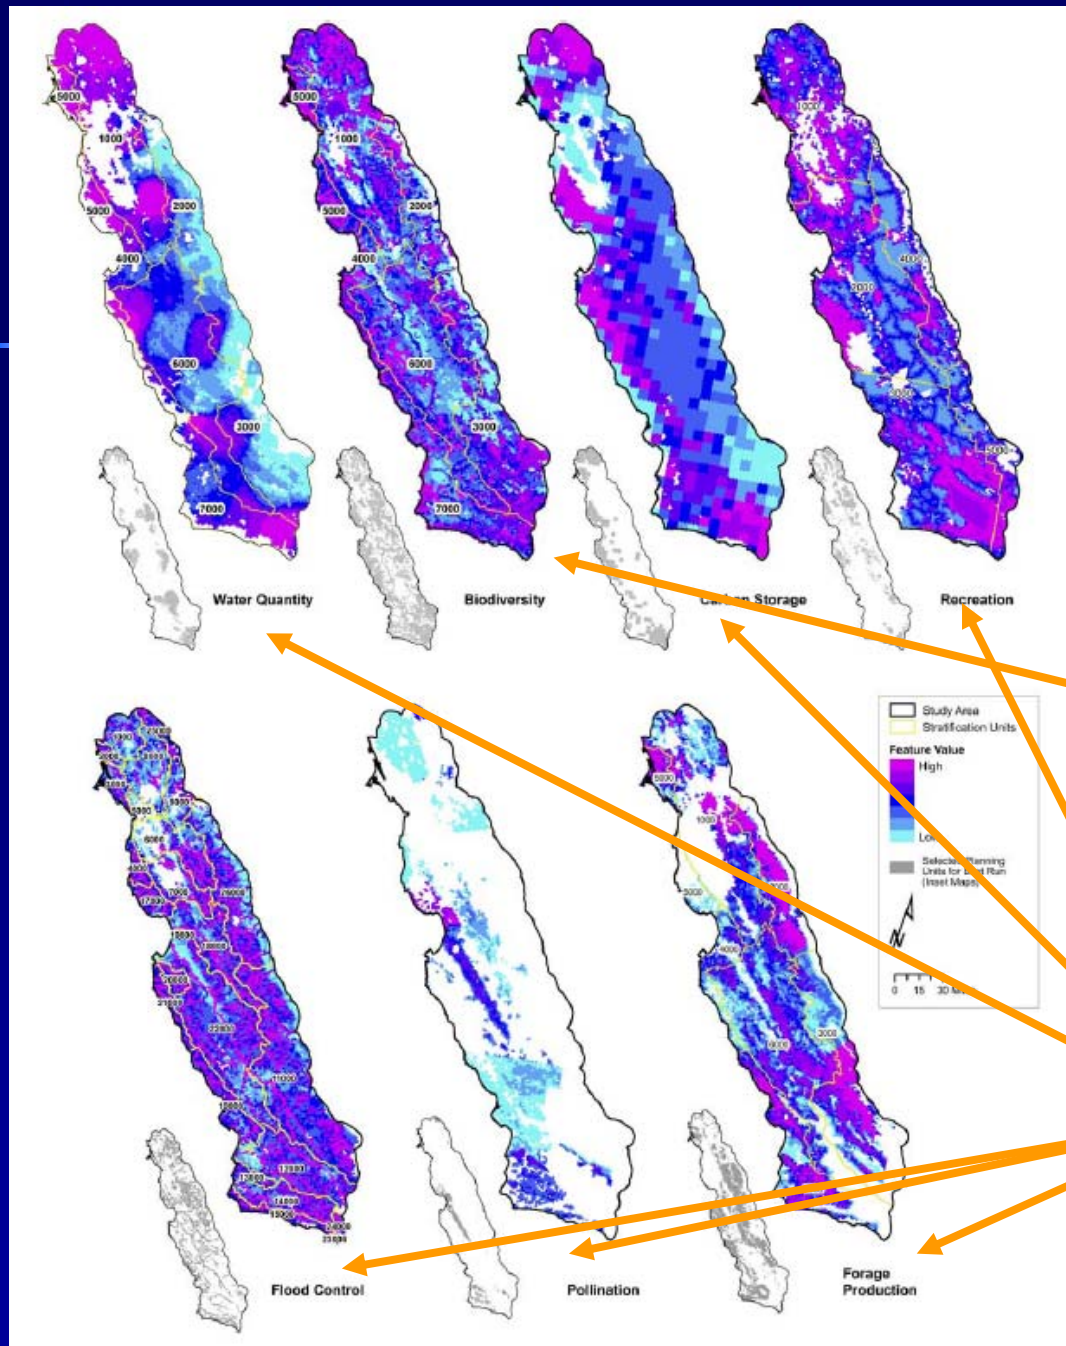

Many studies have now confirmed the links between biodiversity loss and increased disease transmission

**Table 1 | Biodiversity loss can increase transmission**

| Disease                                      | Mechanism | Reference |
|--|-----------|-----------|
| Amphibian limb malformation                  | B         | 12        |
| Bacteriophage of <i>Pseudomonas syringae</i> | B         | 52        |
| Coral diseases                               | A         | 53        |
| Fungal disease of <i>Daphnia</i>             | B         | 54        |
| Hantavirus disease                           | A, B      | 23,55–57  |
| Helminthic parasite of fish                  | A*        | 58        |
| Lyme disease                                 | A, B      | 18,22,59  |
| Malaria                                      | A         | 60        |
| <i>Puccinia</i> rust infection of ryegrass   | A*        | 10        |
| Schistosomiasis                              | B         | 12        |
| Trematode diseases of snails and birds       | B         | 61–63     |
| West Nile fever                              | A*, B*    | 7–9,64    |

A- host/vector abundance

B- host/vector/parasite behaviour

Many studies to date have mapped **biodiversity** and delivery of multiple **ecosystem services**

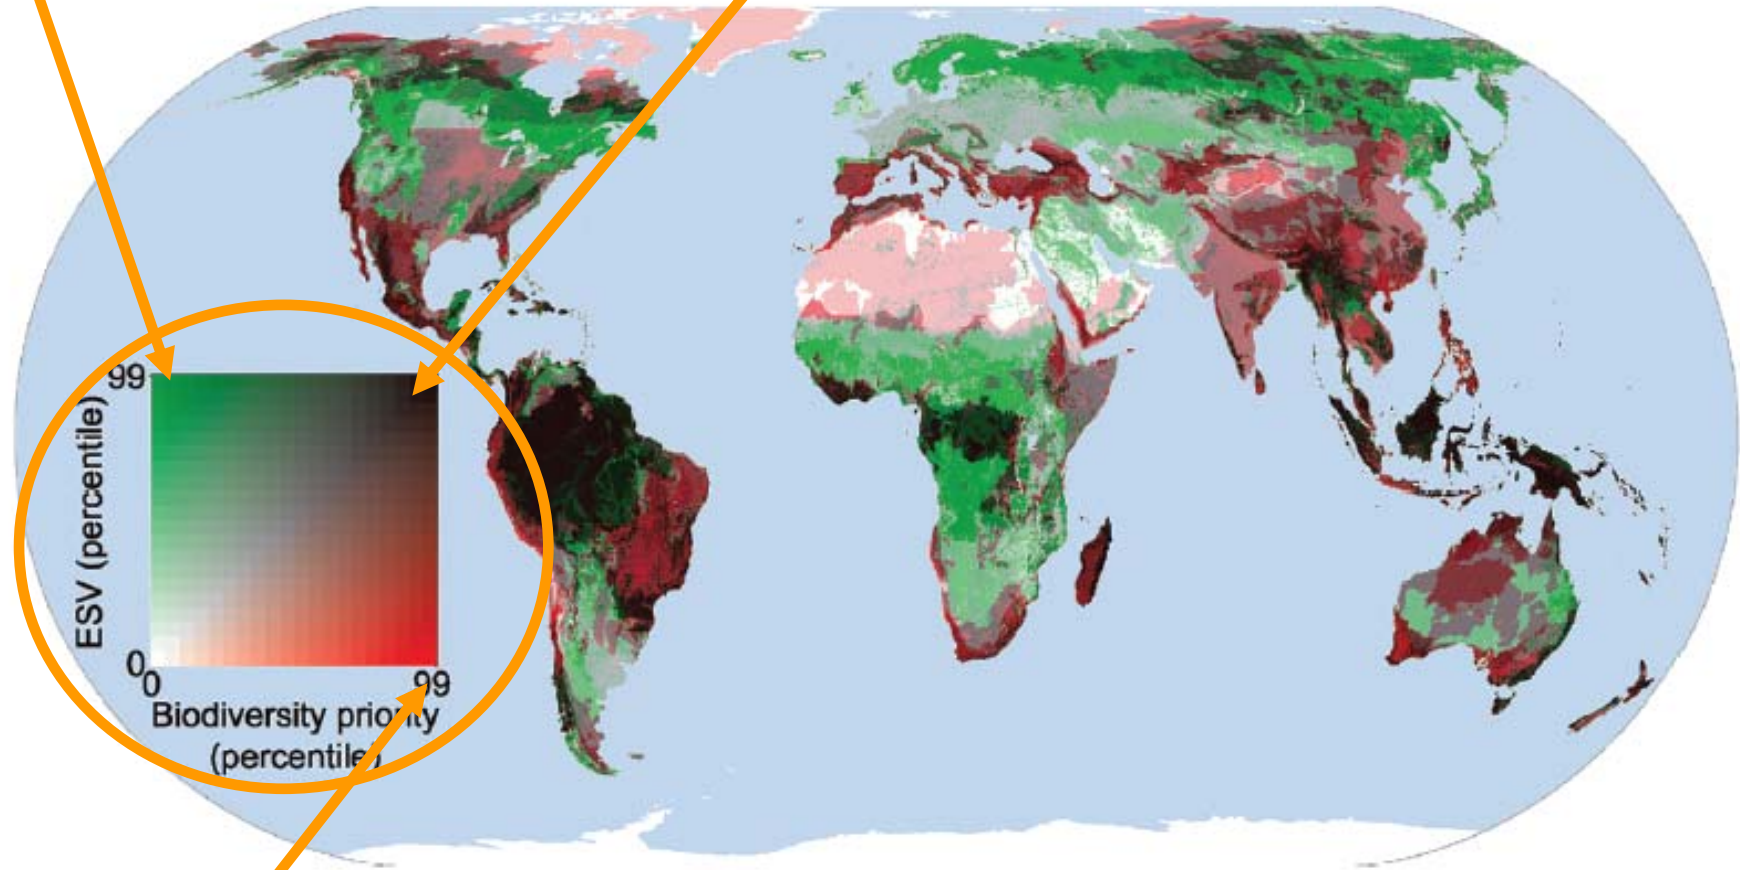

# Patterns of correlations between biodiversity and ecosystem services are not clear cut

| <b>A</b>        | <b>Carbon Storage</b> | <b>Pollination</b> | <b>Recreation</b> | <b>Water Storage</b> | <b>Flood Control</b> | <b>Forage Production</b> | <b>Bio-diversity</b> |
|-----------------|-----------------------|--------------------|-------------------|----------------------|----------------------|--------------------------|----------------------|
| <b>Carbon</b>   | 1                     |                    |                   |                      |                      |                          |                      |
| <b>Pol'n</b>    | 0.04                  | 1                  |                   |                      |                      |                          |                      |
| <b>Rec'n</b>    | 0.19                  | -0.01              | 1                 |                      |                      |                          |                      |
| <b>H2O</b>      | 0.58                  | 0.02               | 0.27              | 1                    |                      |                          |                      |
| <b>Flood</b>    | 0.21                  | 0.00               | 0.24              | 0.17                 | 1                    |                          |                      |
| <b>Forage</b>   | -0.07                 | -0.05              | -0.07             | -0.12                | 0.04                 | 1                        |                      |
| <b>Biod'y</b>   | 0.03                  | -0.01              | 0.12              | 0.10                 | 0.02                 | -0.04                    | 1                    |
| <b>Averages</b> | 0.16                  | 0.00               | 0.12              | 0.17                 | 0.11                 | -0.05                    | 0.04                 |
| <b>Overall</b>  | 0.08                  |                    |                   |                      |                      |                          |                      |

Low overall correlation  
between biodiversity  
and services- California

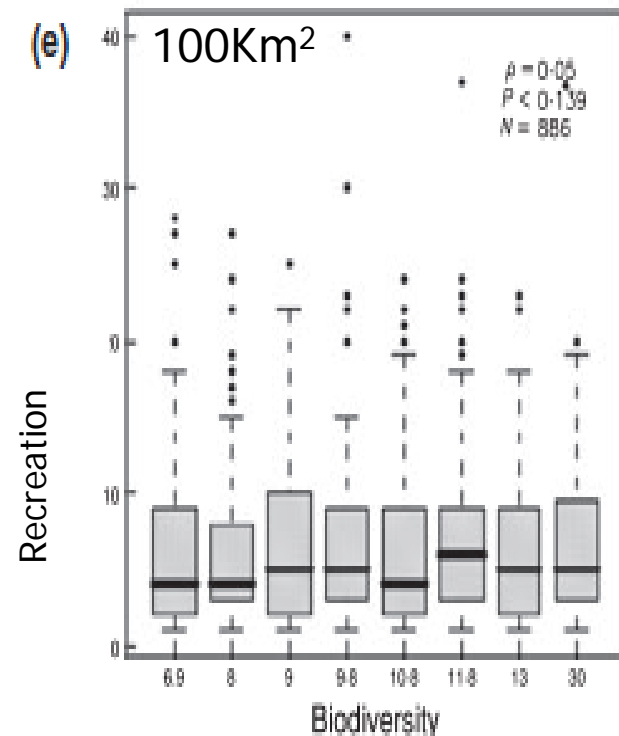

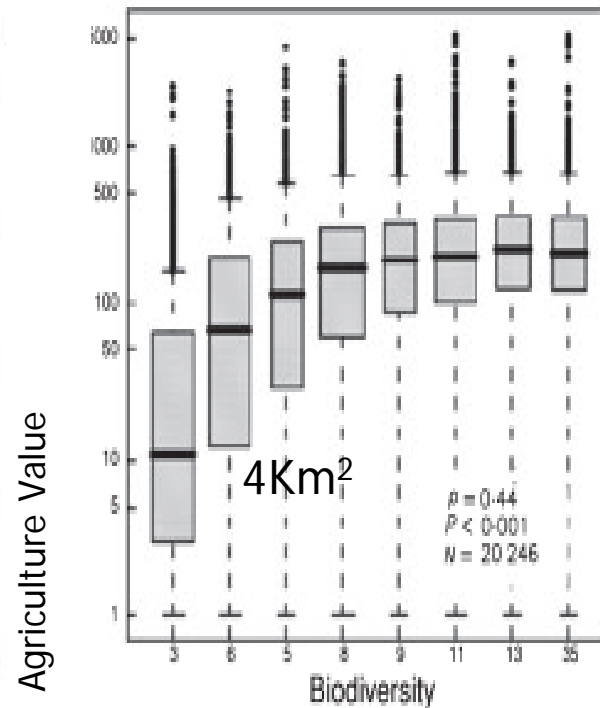

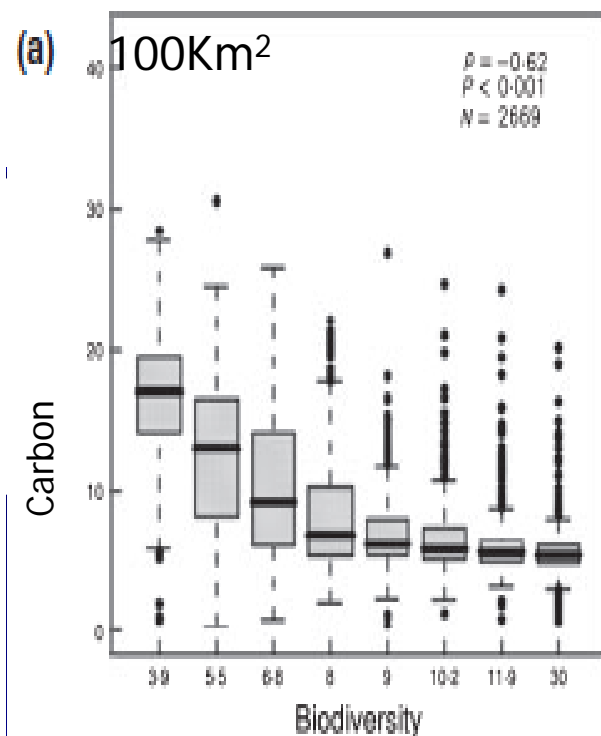

Only services

Both

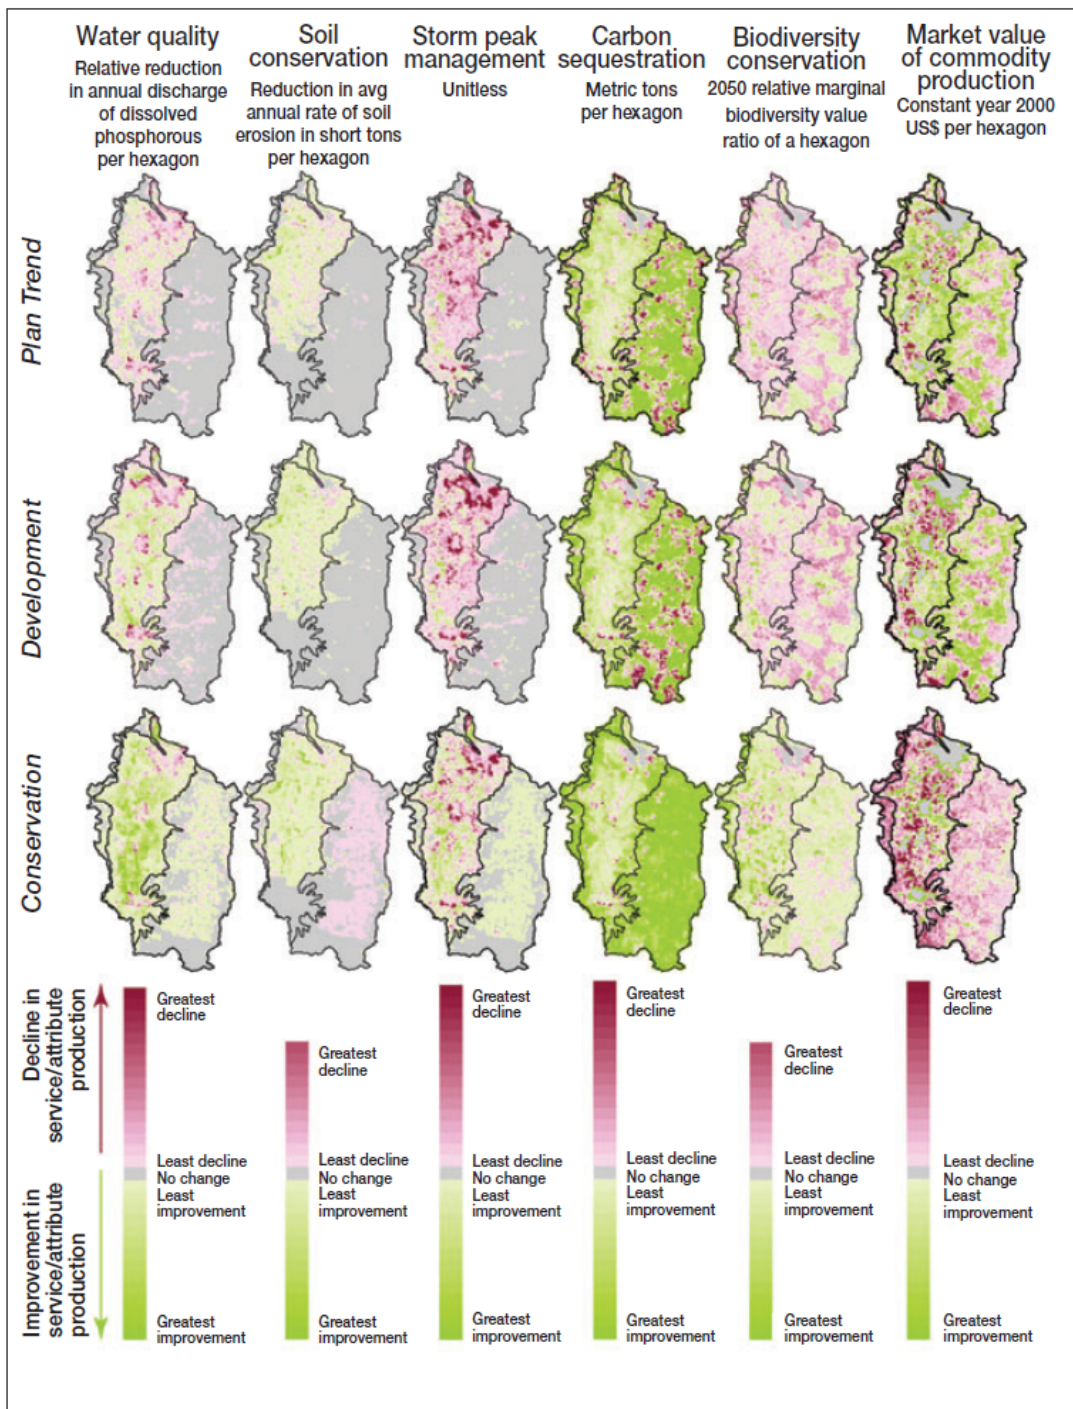

Only  
biodiversity

High spatial variance in  
concordance or discordance

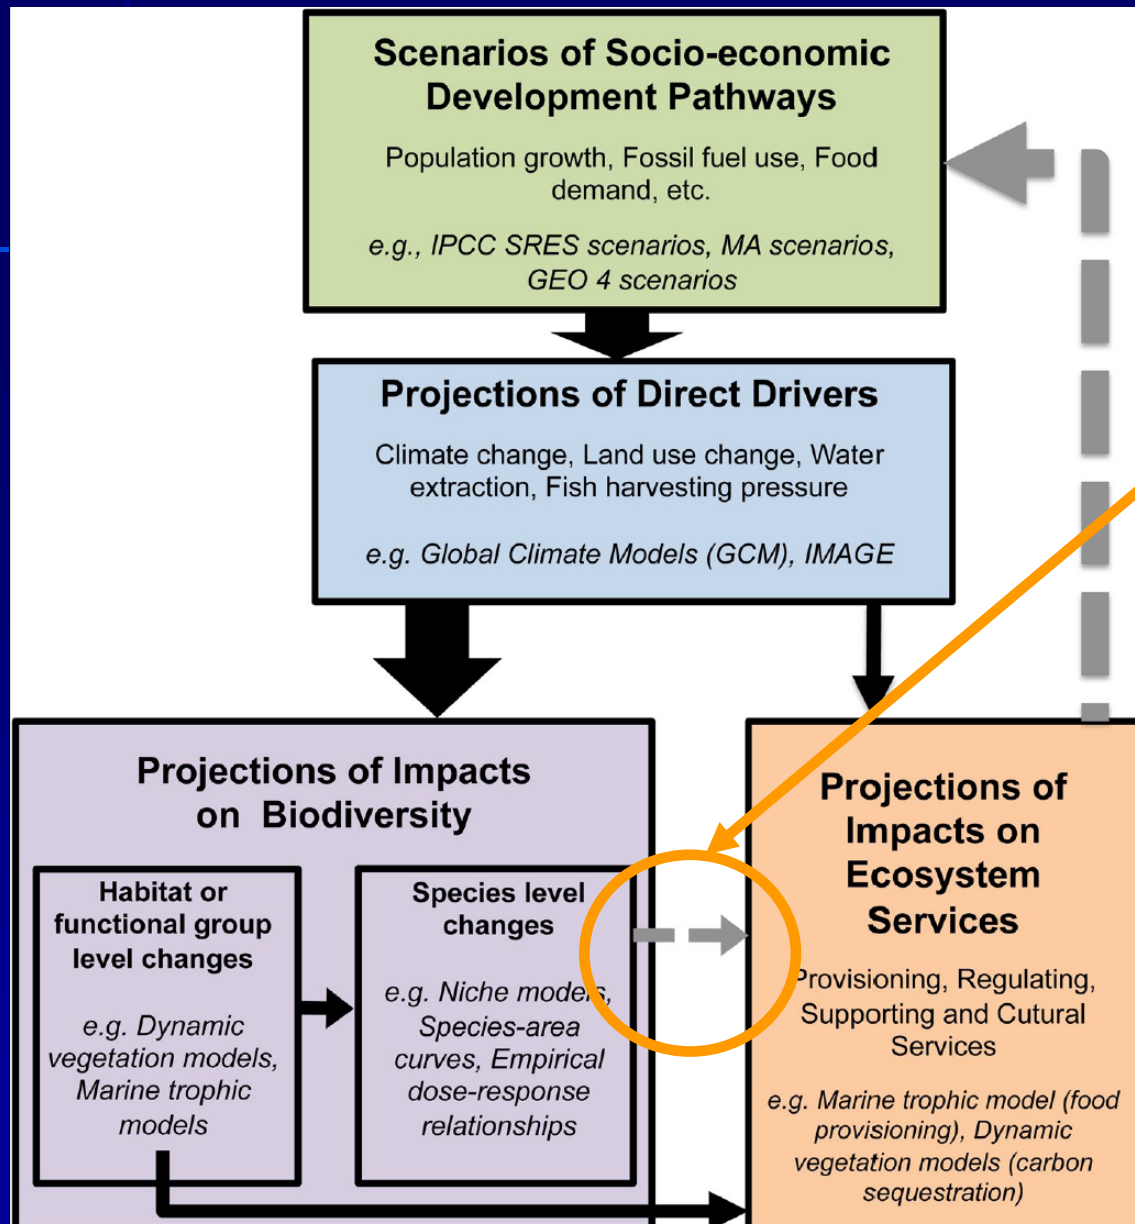

Spatial co-variance among services  
 change with resolution  
 and service - UK

Future scenarios for biodiversity and for ecosystem services have been developed to inform decision making

Nelson et al 2009 Front Ecol Environ 7: 4–11

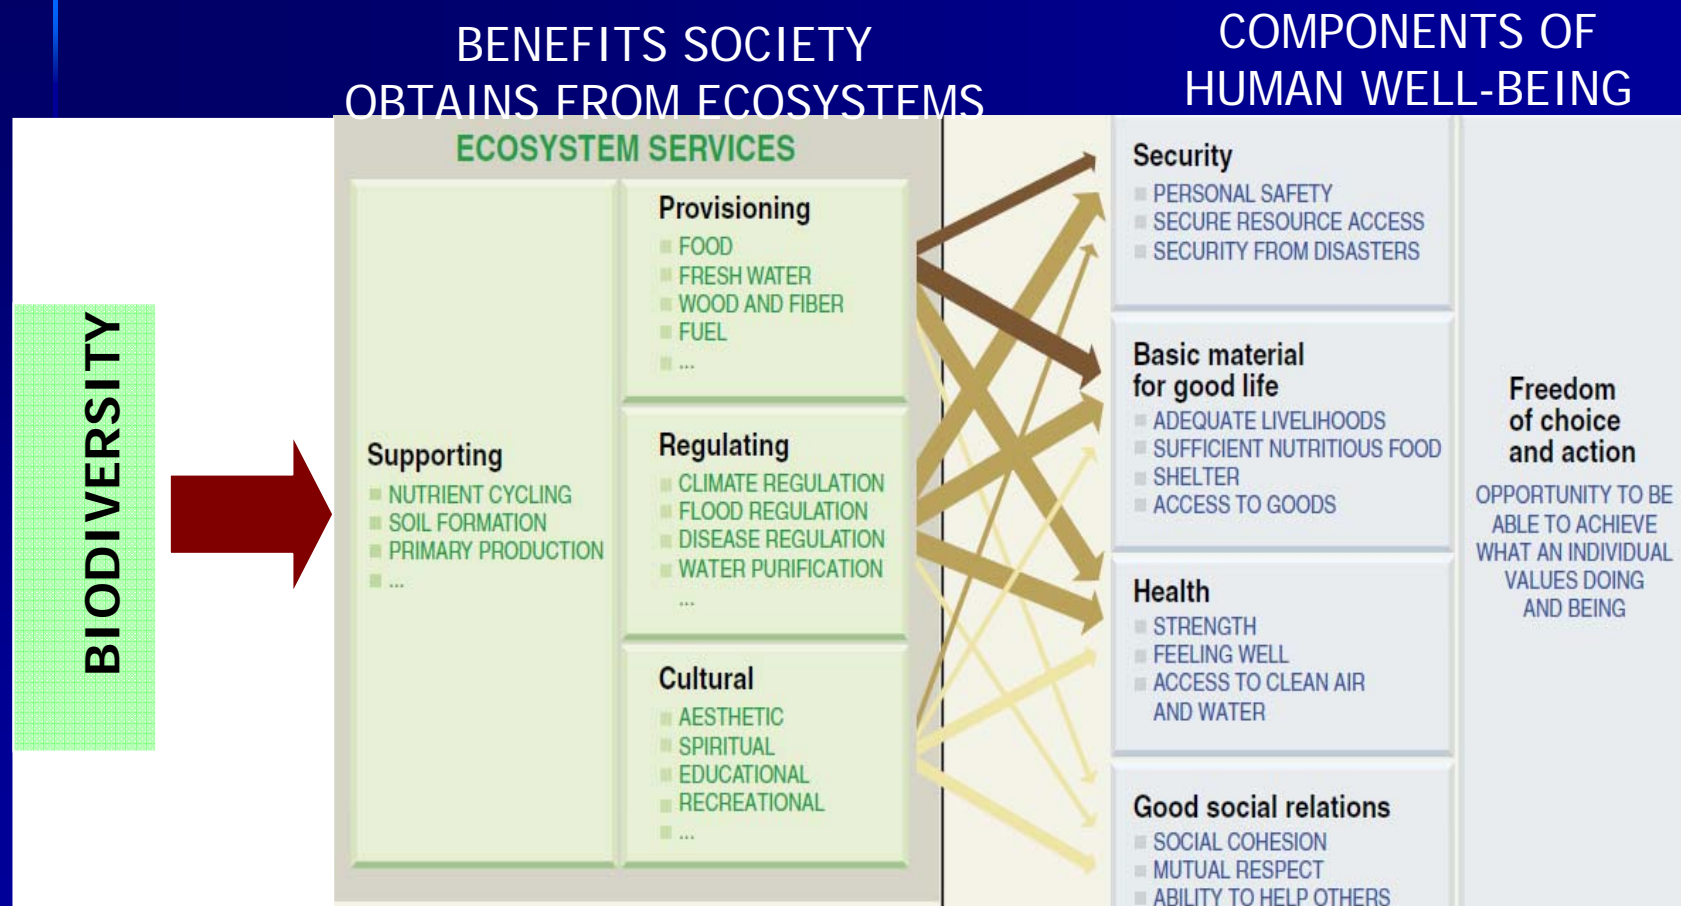

Yet models that predict impacts on ecosystem services based on changes in biodiversity are not yet available

**Biodiversity is important to ecosystem services and well-being, yet the relationship at regional scales is very complex**

# Biodiversity underpins the delivery of ecosystem services and human well-being

Yet the relationship between biodiversity and human well-being is scale dependent and complex

# What do we need to know?

- Role played by a range of biological groups and different diversity components
- Impacts on a wider range of ecosystem services
- Explicit links to human well-being
- Relationships and relative importance at multiple spatial scales
- Synthesis to understand generalities and particularities

**We have shown that  
biodiversity loss will threaten  
ecosystem services delivery and  
human well-being**

**In the face of the new  
Platform for Biodiversity  
and Ecosystem Services  
much more information is  
needed to explicitly link  
biodiversity to well-being  
at multiple spatial scales**
